# 1 Introduction

## 1.1 Scope

The present document describes the AT Command Set for the SIMCom Module:

SIM5218

More information about the SIMCom Module which includes the Software Version information can be retrieved by the command [ATI](#). In this document, a short description, the syntax, the possible setting values and responses, and some examples of AT commands are presented.

Prior to using the Module, please read this document and the Version History to know the difference from the previous document.

In order to implement communication successfully between Customer Application and the Module, it is recommended to use the AT commands in this document, but not to use some commands which are not included in this document.

## 1.2 References

The present document is based on the following standards:

- [1] ETSI GSM 01.04: Abbreviations and acronyms.
- [2] 3GPP TS 27.005: Use of Data Terminal Equipment – Data Circuit terminating Equipment (DTE – DCE) interface for Short Message Service (SMS) and Cell Broadcast Service (CBS).
- [3] 3GPP TS 27.007: AT command set for User Equipment (UE).

## 1.3 Terms and Abbreviations

For the purposes of the present document, the following abbreviations apply:

- AT            ATtention; the two-character abbreviation is used to start a command line to be sent from TE/DTE to TA/DCE
- CSD            Circuit Switched Data
- DCE            Data Communication Equipment; Data Circuit terminating Equipment
- DCS            Digital Cellular Network
- DTE            Data Terminal Equipment
- DTMF            Dual Tone Multi-Frequency
- EDGE            Enhanced Data GSM Environment
- EGPRS            Enhanced General Packet Radio Service
- GPIO            General-Purpose Input/Output
- GPRS            General Packet Radio Service
- GSM            Global System for Mobile communications
- HSDPA            High Speed Downlink Packet Access

▪ HSUPA	High Speed Uplink Packet Access
▪ I2C	Inter-Integrated Circuit
▪ IMEI	International Mobile station Equipment Identity
▪ IMSI	International Mobile Subscriber Identity
▪ ME	Mobile Equipment
▪ MO	Mobile-Originated
▪ MS	Mobile Station
▪ MT	Mobile-Terminated; Mobile Termination
▪ PCS	Personal Communication System
▪ PDU	Protocol Data Unit
▪ PIN	Personal Identification Number
▪ PUK	Personal Unlock Key
▪ SIM	Subscriber Identity Module
▪ SMS	Short Message Service
▪ SMS-SC	Short Message Service – Service Center
▪ TA	Terminal Adaptor; e.g. a data card (equal to DCE)
▪ TE	Terminal Equipment; e.g. a computer (equal to DTE)
▪ UE	User Equipment
▪ UMTS	Universal Mobile Telecommunications System
▪ USIM	Universal Subscriber Identity Module
▪ WCDMA	Wideband Code Division Multiple Access

## 1.4 Definitions and conventions

1. For the purposes of the present document, the following syntactical definitions apply:

<b>&lt;CR&gt;</b>	Carriage return character.
<b>&lt;LF&gt;</b>	Linefeed character.
<b>&lt;...&gt;</b>	Name enclosed in angle brackets is a syntactical element. Brackets themselves do not appear in the command line.
<b>[...]</b>	Optional subparameter of AT command or an optional part of TA information response is enclosed in square brackets. Brackets themselves do not appear in the command line. If subparameter is not given, its value equals to its previous value or the recommended default value.
<b><u>underline</u></b>	Underlined defined subparameter value is the recommended default setting or factory setting.

2. Document conventions:

- ◆ Display the examples of AT commands with *Italic* format.
- ◆ Not display *blank-line* between command line and responses or inside the responses.
- ◆ Generally, the characters <CR> and <LF> are intentionally omitted throughout this document.
- ◆ If command response is ERROR, not list the ERROR response inside command syntax.

**NOTE** AT commands and responses in figures may be not following above conventions.

3. Special marks for commands or parameters:

**SIM PIN** – Is the command PIN protected?

YES – AT command can be used only when SIM PIN is READY.

NO – AT command can be used when SIM card is absent or SIM PIN validation is pending.

**References** – Where is the derivation of command?

3GPP TS 27.007 – 3GPP Technical Specification 127 007.

V.25ter – ITU-T Recommendation V.25ter.

Vendor – The command is supported by SIMCom.

## 2 AT Interface Synopsis

### 2.1 Interface settings

Between Customer Application and the Module, standardized RS-232 interface is used for the communication, and default values for the interface settings as following:

115200bps, 8 bit data, no parity, 1 bit stop, no data stream control.

### 2.2 AT command syntax

The prefix “AT” or “at” (no case sensitive) must be included at the beginning of each command line (except **A/** and **++**), and the character <CR> is used to finish a command line so as to issue the command line to the Module. It is recommended that a command line only includes a command.

When Customer Application issues a series of AT commands on separate command lines, leave a pause between the preceding and the following command until information responses or result codes are retrieved by Customer Application, for example, “OK” is appeared. This advice avoids too many AT commands are issued at a time without waiting for a response for each command.

In the present document, AT commands are divided into three categories: Basic Command, S Parameter Command, and Extended Command.

#### 1. Basic Command

The format of Basic Command is “**AT<x><n>**” or “**AT&<x><n>**”, “<x>” is the command name, and “<n>” is/are the parameter(s) for the basic command, and optional. An example of Basic Command is “**ATE<n>**”, which informs the TA/DCE whether received characters should be echoed back to the TE/DTE according to the value of “<n>”; “<n>” is optional and a default value will be used if omitted.

#### 2. S Parameter Command

The format of S Parameter Command is “**ATS<n>=<m>**”, “<n>” is the index of the S-register to set, and “<m>” is the value to assign to it. “<m>” is optional; in this case, the format is “**ATS<n>**”, and then a default value is assigned.

#### 3. Extended Command

The Extended Command has several formats, as following table list:

**Table 2-1: Types of Extended Command**

Command Type	Syntax	Comments
Test Command	AT+<NAME>=?	Test the existence of the command; give some information about the command subparameters.

Read Command	AT+<NAME>?	Check the current values of subparameters.
Write Command	AT+<NAME>=<...>	Set user-definable subparameter values.
Execution Command	AT+<NAME>	Read non-variable subparameters determined by internal processes.

**NOTE** The character “+” between the prefix “AT” and command name may be replaced by other character. For example, using “#” or “\$” instead of “+”.

## 2.3 Information responses

If the commands included in the command line are supported by the Module and the subparameters are correct if presented, some information responses will be retrieved by from the Module. Otherwise, the Module will report “ERROR” or “+CME ERROR” or “+CMS ERROR” to Customer Application.

Information responses start and end with <CR><LF>, i.e. the format of information responses is “<CR><LF><response><CR><LF>”. Inside information responses, there may be one or more <CR><LF>. Throughout this document, only the responses are presented, and <CR><LF> are intentionally omitted.

## 3 General Commands

### 3.1 ATI Display product identification information

#### Description

The command requests the product information, which consists of manufacturer identification, model identification, revision identification, QCN type, International Mobile station Equipment Identity (IMEI) and overall capabilities of the product.

SIM PIN	References
NO	V.25ter

#### Syntax

Execution Command	Responses
ATI	Manufacturer: <manufacturer> Model: <model> Revision: <revision> QCN: [<qcn_type>] IMEI: <sn> +GCAP: list of <name>s OK

#### Defined values

<manufacturer>	
	The identification of manufacturer.
<model>	
	The identification of model.
<revision>	
	The revision identification of firmware.
<qcn_type>	
	The identification of QCN. QCN is used to save non-volatile values for software.
<sn>	
	Serial number identification, which consists of a single line containing IMEI (International Mobile station Equipment Identity) number.
<name>	
	List of additional capabilities:
+CGSM	GSM function is supported
+FCLASS	FAX function is supported
+DS	Data compression is supported

## Examples

*ATI*

*Manufacturer: SIMCOM INCORPORATED*

*Model: SIMCOM\_SIM5218*

*Revision: M6290A SIM5218\_QCT6290\_2400\_090206\_V1.07 1 [Feb 06 2009 09:41:25]*

*QCN:*

*IMEI: 351602000330570*

*+GCAP: +CGSM, +FCLASS, +DS*

*OK*

## 3.2 AT+CGMI Request manufacturer identification

### Description

The command requests the manufacturer identification text, which is intended to permit the user of the Module to identify the manufacturer.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CGMI=?	OK
Execution Command	Responses
AT+CGMI	<manufacturer> OK

### Defined values

<manufacturer>

The identification of manufacturer.

### Examples

*AT+CGMI*

*SIMCOM INCORPORATED*

*OK*

## 3.3 AT+CGMM Request model identification

### Description

The command requests model identification text, which is intended to permit the user of the Module to identify the specific model.

SIM PIN	References
NO	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CGMM=?	OK
Execution Command	Responses
AT+CGMM	<model> OK

## Defined values

<model>
The identification of model.

## Examples

AT+CGMM
SIMCOM_SIM5218
OK

## 3.4 AT+CGMR Request revision identification

### Description

The command requests product firmware revision identification text, which is intended to permit the user of the Module to identify the version, revision level, date, and other pertinent information.

SIM PIN	References
NO	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CGMR=?	OK
Execution Command	Responses
AT+CGMR	<revision> OK

## Defined values

<revision>

The revision identification of firmware.

## Examples

*AT+CGMR*

+CGMR: M6290A SIM5218\_QCT6290\_2400\_090206\_V1.07 I [Feb 06 2009 09:41:25]

OK

## 3.5 AT+CGSN Request product serial number identification

### Description

The command requests product serial number identification text, which is intended to permit the user of the Module to identify the individual ME to which it is connected to.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CGSN=?	OK
Execution Command	Responses
AT+CGSN	<sn> OK

### Defined values

<sn>

Serial number identification, which consists of a single line containing the IMEI (International Mobile station Equipment Identity) number of the MT.

## Examples

*AT+CGSN*

351602000330570

OK

## 3.6 AT+CSCS Select TE character set

### Description

Write command informs TA which character set <chset> is used by the TE. TA is then able to convert character strings correctly between TE and MT character sets.

Read command shows current setting and test command displays conversion schemes implemented in the TA.

SIM PIN	References
YES	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CSCS=?	+CSCS: (list of supported <chset>s) OK
Read Command	Responses
AT+CSCS?	+CSCS: <chset> OK
Write Command	Responses
AT+CSCS=<chset>	OK ERROR
Execution Command	Responses
AT+CSCS	<i>Set subparameters as default value:</i> OK

## Defined values

### <chset>

Character set, the definition as following:

- “IRA” International reference alphabet.
- “GSM” GSM default alphabet; this setting causes easily software flow control (XON /XOFF) problems.
- “UCS2” 16-bit universal multiple-octet coded character set; UCS2 character strings are converted to hexadecimal numbers from 0000 to FFFF.

## Examples

```
AT+CSCS="IRA"
OK
AT+CSCS?
+CSCS:"IRA"
OK
```

## 3.7 AT+CIMI Request international mobile subscriber identity

## Description

Execution command causes the TA to return <IMSI>, which is intended to permit the TE to identify the individual SIM card which is attached to MT.

SIM PIN	References
YES	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CMII=?	OK
Execution Command	Responses
AT+CMII	<IMSI> OK

## Defined values

<IMSI>

International Mobile Subscriber Identity (string, without double quotes).

## Examples

```
AT+CMII
460010222028133
OK
```

## 3.8 AT+GCAP Request overall capabilities

### Description

Execution command causes the TA reports a list of additional capabilities.

SIM PIN	References
YES	V.25ter

## Syntax

Test Command	Responses
AT+GCAP=?	OK
Execution Command	Responses
AT+GCAP	+GCAP: (list of <name>s) OK

## Defined values

<name>
List of additional capabilities.
+CGSM      GSM function is supported
+FCLASS     FAX function is supported
+DS          Data compression is supported

## Examples

```
AT+GCAP
+GCAP:+CGSM,+FCLASS,+DS
OK
```

## 3.9 AT+CSTR Configure URC destination interface

### Description

The command is used to configure the interface which will be used to output URCs.

SIM PIN	References
NO	Vendor

### Syntax

Test Command	Responses
AT+CSTR=?	+CSTR: (list of supported <port>s),( list of supported <save>s) OK
Read Command	Responses
AT+CSTR?	+CSTR: <port> OK
Write Command	Responses
AT+CSTR=<port>[,<save>]	OK ERROR

### Defined values

<port>
0 – all ports
1 – use UART port to output URCs
2 – use MODEM port to output URCs
3 – use ATCOM port to output URCs
<save>
0 – set temporarily
1 – set permanently

## Examples

```
AT+CATR=1,0
```

```
OK
```

```
AT+CATR?
```

```
+CATR: 1
```

```
OK
```

## 3.10 A/ Repeat last command

### Description

The command is used for implement previous AT command repeatedly (except A/), and the return value depends on the last AT command. If A/ is issued to the Module firstly after power on, the response “OK” is only returned.

References

V.25ter

### Syntax

Execution Command	Responses
A/	<i>The response the last AT command return</i>

## Examples

```
AT+GCAP
```

```
+GCAP:+CGSM,+FCLASS,+DS
```

```
OK
```

```
A/
```

```
+GCAP:+CGSM,+FCLASS,+DS
```

```
OK
```

## 4 Call Control Commands and Methods

### 4.1 AT+CSTA Select type of address

#### Description

Write command is used to select the type of number for further dialing commands ([ATD](#)) according to GSM/UMTS specifications.

Read command returns the current type of number.

Test command returns values supported by the Module as a compound value.

SIM PIN	References
YES	3GPP TS 27.007

#### Syntax

Test Command	Responses
AT+CSTA=?	+CSTA:(list of supported <type>s) OK
Read Command	Responses
AT+CSTA?	+CSTA:<type> OK
Write Command	Responses
AT+CSTA=<type>	OK ERROR
Execution Command	Responses
AT+CSTA	OK

#### Defined values

##### <type>

Type of address octet in integer format:

- 145 – when dialling string includes international access code character “+”
- 129 – otherwise

**NOTE** Because the type of address is automatically detected on the dial string of dialling command, command [AT+CSTA](#) has really no effect.

#### Examples

```
AT+CSTA?  
+CSTA: 129  
OK  
AT+CSTA=145
```

*OK*

## 4.2 AT+CMOD Call mode

### Description

Write command selects the call mode of further dialing commands ([ATD](#)) or for next answering command ([ATA](#)). Mode can be either single or alternating.

Test command returns values supported by the TA as a compound value.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CMOD=?	+CMOD: (list of supported <mode>s) OK
Read Command	Responses
AT+CMOD?	+CMOD: <mode> OK
Write Command	Responses
AT+CMOD=<mode>	OK ERROR
Execution Command	Responses
AT+CMOD	<i>Set default value:</i> OK

### Defined values

<mode>
<u>0</u> – single mode(only supported)
<b>NOTE</b> The value of <mode> shall be set to zero after a successfully completed alternating mode call. It shall be set to zero also after a failed answering. The power-on, factory and user resets shall also set the value to zero. This reduces the possibility that alternating mode calls are originated or answered accidentally.

### Examples

```
AT+CMOD?  
+CMOD: 0  
OK  
AT+CMOD=0
```

*OK*

## 4.3 ATD Dial command

### Description

The dial command lists characters that may be used in a dialling string for making a call or controlling supplementary services.

SIM PIN References

YES V25.ter

### Syntax

Execution Commands	Responses
ATD<n>[<mgsms>][;]	OK
	VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i>
	NO CARRIER

### Defined values

<n>

String of dialing digits and optionally V.25ter modifiers dialing digits:

0 1 2 3 4 5 6 7 8 9 \* # + A B C

Following V.25ter modifiers are ignored:

, T P ! W @

<mgsms>

String of GSM modifiers:

I Activates CLIR (disables presentation of own phone number to called party)

i Deactivates CLIR (enables presentation of own phone number to called party)

G Activate Closed User Group explicit invocation for this call only

g Deactivate Closed User Group explicit invocation for this call only

<;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

### Examples

ATD10086;

*OK*

*VOICE CALL:BEGIN*

## 4.4 ATD><mem><n> Originate call from specified memory

## Description

Originate a call using specified memory and index number.

SIM PIN	References
YES	V.25ter

## Syntax

Execution Commands	Responses
ATD><mem><n>[;]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i> NO CARRIER

## Defined values

### <mem>

Phonebook storage: (For detailed description of storages see [AT+CPBS](#))

"DC"	ME dialed calls list
"MC"	ME missed (unanswered received) calls list
"RC"	ME received calls list
"SM"	SIM phonebook
"ME"	UE phonebook
"FD"	SIM fixed dialing phonebook
"ON"	MSISDN list
"LD"	Last number dialed phonebook
"EN"	Emergency numbers

### <n>

Integer type memory location in the range of locations available in the selected memory, i.e. the index returned by [AT+CPBR](#).

### <;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

## Examples

```
ATD>SM3;
OK
VOICE CALL: BEGIN
```

## 4.5 ATD><n> Originate call from active memory (1)

### Description

Originate a call to specified number.

SIM PIN	References
YES	V.25ter

## Syntax

Execution Commands	Responses
ATD><n>[;]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i> NO CARRIER

## Defined values

<n>

Integer type memory location in the range of locations available in the selected memory, i.e. the index number returned by [AT+CPBR](#).

<;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

## Examples

```
ATD>2;  
OK  
VOICE CALL: BEGIN
```

## 4.6 ATD><str> Originate call from active memory (2)

### Description

Originate a call to specified number.

SIM PIN	References
YES	V.25ter

## Syntax

Execution Commands	Responses
ATD><str>[;]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i> NO CARRIER

## Defined values

<str>

String type value, which should equal to an alphanumeric field in at least one phone book entry in the searched memories. <str> formatted as current TE character set specified by [AT+CSCS](#).

<;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

## Examples

*ATD>Kobe;*

*OK*

*VOICE CALL: BEGIN*

## 4.7 ATA Call answer

### Description

The command is used to make remote station to go off-hook, e.g. answer an incoming call. If there is no an incoming call and entering this command to TA, it will be return “[NO CARRIER](#)” to TA.

SIM PIN	References
YES	V.25ter

### Syntax

Execution Commands	Responses
ATA	<i>For voice call:</i> OK VOICE CALL: BEGIN
	<i>For data call, and TA switchs to data mode:</i> CONNECT
	<i>No connection or no incoming call:</i> NO CARRIER

## Examples

*ATA*

*VOICE CALL: BEGIN*

*OK*

## 4.8 +++ Switch from data mode to command mode

## Description

The command is only available during a connecting CSD call. The `+++` character sequence causes the TA to cancel the data flow over the AT interface and switch to Command Mode. This allows to enter AT commands while maintaining the data connection to the remote device.

**NOTE** To prevent the `+++` escape sequence from being misinterpreted as data, it must be preceded and followed by a pause of at least 1000 milliseconds, and the interval between two '+' character can't exceed 900 milliseconds.

SIM PIN	References
YES	V.25ter

## Syntax

Execution Command	Responses
<code>+++</code>	<code>OK</code>

## Examples

```
+++  
OK
```

## 4.9 ATO Switch from command mode to data mode

### Description

`ATO` is the corresponding command to the `+++` escape sequence. When there is a CSD call connected and the TA is in Command Mode, `ATO` causes the TA to resume the data and takes back to Data Mode.

SIM PIN	References
YES	V.25ter

## Syntax

Execution Command	Responses
<code>ATO</code>	<p><i>TA/DCE switches to Data Mode from Command Mode:</i></p> <p><code>CONNECT</code></p> <p><i>If connection is not successfully resumed or there is not a connected CSD call:</i></p> <p><code>NO CARRIER</code></p>

## Examples

```
ATO
```

*CONNECT*

## 4.10 AT+CVHU Voice hang up control

### Description

Write command selects whether [ATH](#) or “[drop DTR](#)” shall cause a voice connection to be disconnected or not. By voice connection is also meant alternating mode calls that are currently in voice mode.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CVHU=?	+CVHU: (list of supported <mode>s) OK
Read Command	Responses
AT+CVHU?	+CVHU: <mode> OK
Write Command	Responses
AT+CVHU=<mode>	OK ERROR
Execution Command	Responses
AT+CVHU	<i>Set default value:</i> OK

### Defined values

<mode>
0 – “ <a href="#">Drop DTR</a> ” ignored but OK response given. <a href="#">ATH</a> disconnects.
<u>1</u> – “ <a href="#">Drop DTR</a> ” and <a href="#">ATH</a> ignored but OK response given.

### Examples

AT+CVHU=0
OK
AT+CVHU?
+CVHU: 0
OK

## 4.11 ATH Disconnect existing call

## Description

The command is used to disconnect existing voice call. Before using **ATH** command to hang up a voice call, it must set **AT+CVHU=0**. Otherwise, ATH command will be ignored and “OK” response is given only.

The command is also used to disconnect CSD, and in this case it doesn't depend on the value of **AT+CVHU**.

SIM PIN	References
NO	V.25ter

## Syntax

Execution Command	Responses
ATH	<i>If AT+CVHU=0:</i> VOICE CALL: END: <time> OK OK

## Defined values

<time>
Voice call connection time:
Format – HHMMSS (HH: hour, MM: minute, SS: second)

## Examples

```
AT+CVHU=0
OK
ATH
VOICE CALL:END:000017
OK
```

## 4.12 AT+CHUP Hang up call

### Description

The command is used to cancel voice calls. If there is no call, it will do nothing but OK response is given.

SIM PIN	References
NO	3GPP TS 27.007

## Syntax

Test Command	Responses
--------------	-----------

AT+CHUP=?	OK
Execution Command	Responses
AT+CHUP	VOICE CALL: END: <time> OK
	<i>No call:</i>
	OK

## Defined values

<speed>

- 0 – autobauding(automatic selection of the speed; this setting is possible in case of 3.1 kHz modem and non-transparent service)
- 7 – 9600 bps (V.32)
- 12 – 9600 bps (V.34)
- 14 – 14400 bps(V.34)
- 16 – 28800 bps(V.34)
- 17 – 33600 bps(V.34)
- 39 – 9600 bps(V.120)
- 43 – 14400 bps(V.120)
- 48 – 28800 bps(V.120)
- 51 – 56000 bps(V.120)
- 71 – 9600 bps(V.110)
- 75 – 14400 bps(V.110)
- 80 – 28800 bps(V.110 or X.31 flag stuffing)
- 81 – 38400 bps(V.110 or X.31 flag stuffing)
- 83 – 56000 bps(V.110 or X.31 flag stuffing)
- 84 – 64000 bps(X.31 flag stuffing)
- 116 – 64000 bps(bit transparent)
- 134 – 64000 bps(multimedia)

<name>

- 0 – Asynchronous modem
- 1 – Synchronous modem
- 4 – data circuit asynchronous (RDI)

<ce>

- 0 – transparent
- 1 – non-transparent

**NOTE** If <speed> is set to 116 or 134, it is necessary that <name> is equal to 1 and <ce> is equal to 0.

## 4.14 AT+CRLP Radio link protocol

### Description

Radio Link Protocol(RLP) parameters used when non-transparent data calls are originated may be altered with write command.

Read command returns current settings for each supported RLP version <verX>. Only RLP parameters applicable to the corresponding <verX> are returned.

Test command returns values supported by the TA as a compound value. If ME/TA supports several RLP versions <verX>, the RLP parameter value ranges for each <verX> are returned in a separate line.

### Defined values

<ver>, <verX>

RLP version number in integer format, and it can be 0, 1 or 2; when version indication is not

present it shall equal 1.

<iws>

IWF to MS window size.

<mws>

MS to IWF window size.

<T1>

Acknowledgement timer.

<N2>

Retransmission attempts.

<T4>

Re-sequencing period in integer format.

**NOTE** <T1> and <T4> are in units of 10 ms.

## Examples

## 4.15 AT+CR Service reporting control

### Description

Write command controls whether or not intermediate result code “+CR: <serv>” is returned from the TA to the TE. If enabled, the intermediate result code is transmitted at the point during connect negotiation at which the TA has determined which speed and quality of service will be used, before any error control or data compression reports are transmitted, and before the intermediate result code CONNECT is transmitted.

SIM PIN	References

## 4.16 AT+CEER Extended error report

### Description

Execution command causes the TA to return the information text <report>, which should offer the user of the TA an extended report of the reason for:

- 1 the failure in the last unsuccessful call setup(originating or answering) or in-call modification.
- 2 the last call release.
- 3 the last unsuccessful GPRS attach or unsuccessful PDP context activation.
- 4 the last GPRS detach or PDP context deactivation.

## 4.17 AT+CRC Cellular result codes

### Description

Write command controls whether or not the extended format of incoming call indication or GPRS network request for PDP context activation is used. When enabled, an incoming call is indicated to the TE with unsolicited result code “+CRING: <type>” instead of the normal RING. Test command returns values supported by the TA as a compound value.

## 4.18 AT+VTS DTMF and tone generation

### Description

The command allows the transmission of DTMF tones and arbitrary tones which cause the Mobile Switching Center (MSC) to transmit tones to a remote subscriber. The command can only be used in voice mode of operation (active voice call).

**NOTE** The END event of voice call will terminate the transmission of tones, and as an operator option, the tone may be ceased after a pre-determined time whether or not tone duration has been reached.

## Defined values

<dtmf>

A single ASCII character in the set 0-9, \*, #, A, B, C, D.

<duration>

Tone duration in 1/10 seconds, from 0 to 255. This is interpreted as a DTMF tone of different duration from that mandated by the [AT+VTD](#) command, otherwise, the duration which be set the [AT+VTD](#) command will be used for the tone (<duration> is omitted).

<dtmf-string>

A sequence of ASCII character in the set 0-9, \*, #, A, B, C, D, and maximal length of the string is 29. The string must be enclosed in double quotes (""), and separated by commas between the ASCII characters (e.g. "1,3,5,7,9,\*"). Each of the tones with a duration which is set by the [AT+VTD](#) command.

AT+VPSOURCE=?	OK
Write Command	Responses
AT+VPSOURCE= <i>&lt;src&gt;</i> [, <i>&lt;fname&gt;</i> ]	OK

## Defined values

*<src>*

The Module supports three TX sources – CAMERA, STATIC IMAGE, and FILE SOURCE. In spite of which TX source is used, the size of video frames must be 176\* 144(pixel).

- 1 – Capture video from camera. (default value)
- 2 – Send a static image, support JPEG and BMP format.
- 3 – Send video frames from file, support MP4 and 3GP format.

*<fname>*

Image or video file which is existed in current directory [refer to [AT+FSCD](#)], and it includes extension name.

### NOTE

1. If *<src>*=1, *<fname>*must be ignored, otherwise *<fname>* must be specified.
2. If the TX source is CAMERA, please make sure the camera is OK, otherwise, video call may not be connected successfully.

## Examples

```
AT+VPSOURCE=1
OK
AT+VPSOURCE=2, "image_0.jpg"
OK
AT+VPSOURCE=3, "video_0.mp4"
OK
```

## 5.6 AT+VPRECORD Record video during video call

### Description

Both far-end and near-end video can be recorded in MP4 format during a video call. File name will be generated automatically based on system time of the Module, and the format is *YYYYMMDD\_HHMMSS\_f.mp4* and *YYYYMMDD\_HHMMSS\_n.mp4*.

*YYYYMMDD\_HHMMSS\_f.mp4* denotes that video recorded is from other side.

*YYYYMMDD\_HH MMSS\_n.mp4* denotes that video recorded is transmitted to remote party.

The storage location of files refers to [AT+FSLOCA](#).

Write Command	Responses
AT+VPRECORD=<side>	OK

## Defined values

<side>
0 – not record video.
1 – only record far-end video.
2 – only record near-end video.
3 – record both far-end and near-end.

## Examples

AT+VPRECORD=1

	<i>No connected video call:</i> ERROR

## Defined values

<num>

Integer type value indicating that it will loopback a video frame after receiving <num> video frames from remote party.

- 255 – Not loopback far-end video frame.
- 1~254 – Interval of video frame; if <num> is too small, it will release video frame from far-end before previous video frame is looped back.

## Examples

AT+VPLOOP=?
+VPLOOP: (1-255)
OK
AT+VPLOOP?
+VPLOOP: 255
OK

## 5.8 AT+VPSM Switch video call to CSD mode

### Description

The command is used to switch video call to CSD mode. In CSD mode, it will report RING but not VPINCOM when remote party originated a video call, and then use command ATA to answer the incoming call. After call is connected, data stream from network is flowed over the interface, and command +++ is used to switch from Data Mode to Command Mode, however, the data flow is not cancelled and command ATO is forbidden. In CSD mode, command +VPMODE can't originate a video call.

## 6 SMS Related Commands

### 6.1 +CMS ERROR Message service failure result code

#### Description

Final result code +CMS ERROR: <err> indicates an error related to mobile equipment or network. The operation is similar to ERROR result code. None of the following commands in the same command line is executed. Neither ERROR nor OK result code shall be returned. ERROR is returned normally when error is related to syntax or invalid parameters. The format of <err> can be either numeric or verbose. This is set with command [AT+CMEE](#).

+CMS ERROR: <err>

## Defined values

<mem1>

String type, memory from which messages are read and deleted (commands List Messages AT+CMGL, Read Message AT+CMGR and Delete Message AT+CMGD).

- “ME” and “MT” FLASH message storage
- “SM” SIM message storage
- “SR” Status report storage

<mem2>

String type, memory to which writing and sending operations are made (commands Send Message from Storage AT+CMSS and Write Message to Memory AT+CMGW).

- “ME” and “MT” FLASH message storage
- “SM” SIM message storage
- “SR” Status report storage

<mem3>

String type, memory to which received SMS is preferred to be stored (unless forwarded directly to TE; refer command New Message Indications AT+CNMI).

- “ME” FLASH message storage
- “SM” SIM message storage

<usedX>

Integer type, number of messages currently in <memX>.

<totalX>

Integer type, total number of message locations in <memX>.

## Examples

```
AT+CPMS=?

Write Command	Responses
AT+CSCA=<sca>[,<tosca>]	OK

## Defined values

<sca>

Service Center Address, value field in string format, BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set (refer to command AT+CSGS), type of address given by <tosca>.

<tosca>

SC address Type-of-Address octet in integer format, when first character of <sca> is + (IRA 43) default is 145, otherwise default is 129.

## Examples

AT+CSCA="+8613012345678"

## Defined values

### <mode>

- 0 – message types specified in <mids> and <dcss> are accepted.
- 1 – message types specified in <mids> and <dcss> are not accepted.

### <mides>

String type; all different possible combinations of CBM message identifiers.

### <dcss>

String type; all different possible combinations of CBM data coding schemes(default is empty string)

## Examples

```
AT+CSCB=?  
+CSCB: (0-1)  
OK  
AT+CSCB=0,"15-17,50,86","",""

## Defined values

<show>
<u>0</u> – do not show header values defined in commands <b>AT+CSCA</b> and <b>AT+CSMP</b> (<sca>, <tosca>, <fo>, <vp>, <pid> and <dcs>) nor <length>, <toda> or <tooa> in +CMT, <b>AT+CMGL</b> , <b>AT+CMGR</b> result codes for SMS-DELIVERs and SMS-SUBMITs in text mode; for SMS-COMMANDs in <b>AT+CMGR</b> result code, do not show <pid>, <mn>, <da>, <toda>, <length> or <data>
1 – show the values in result codes

## Examples

```
AT+CSDH?  
+CSDH: 0  
OK  
AT+CSDH=1  
OK
```

## 6.8 AT+CNMA New message acknowledgement to ME/TA

### Description

The command confirms successful receipt of a new message (SMS-DELIVER or SMS-STATUSREPORT) routed directly to the TE. If ME does not receive acknowledgement within required time (network timeout), it will send RP-ERROR to the network.

**NOTE** The execute / write command shall only be used when **AT+CSMS** parameter <service> equals 1 (=phase 2+) and appropriate URC has been issued by the module, i.e.:

<+CMT> for <mt>=2 incoming message classes 0, 1, 3 and none;  
<+CMT> for <mt>=3 incoming message classes 0 and 3;

<+CDS> for <ds>=1.

SIM PIN	References

Execution Command	Responses
AT+CNMA	OK ERROR +CMS ERROR: <err>

## Defined values

### <n>

Parameter required only for PDU mode.

- 0 – Command operates similarly as in text mode.
- 1 – Send positive (RP-ACK) acknowledgement to the network. Accepted only in PDU mode.
- 2 – Send negative (RP-ERROR) acknowledgement to the network. Accepted only in PDU mode.

## Examples

```
AT+CNMI=1,2,0,0,0
OK
+CMT:"1380022xxxx","02/04/03,11:06:38",129,7,0<CR><LF>

OK
```

**AT+CNMA**  
**+CMS ERROR: 340**  
*(the second time return error, it needs ACK only once)*

## 6.9 AT+CNMI New message indications to TE

### Description

The command is used to select the procedure how receiving of new messages from the network is indicated to the TE when TE is active, e.g. DTR signal is ON. If TE is inactive (e.g. DTR signal is OFF). If set **<mt>**=2, **<mt>**=3 or **<ds>**=1, make sure **<mode>**=1, otherwise it will return error.

Execution Command	Responses
AT+CNMI	<i>Set default value:</i> OK

### Defined values

<mode>	
<u>0</u>	– Buffer unsolicited result codes in the TA. If TA result code buffer is full, indications can be buffered in some other place or the oldest indications may be discarded and replaced with the new received indications.
1	– Discard indication and reject new received message unsolicited result codes when TA-TE link is reserved (e.g. in on-line data mode). Otherwise forward them directly to the TE.

- 2 – Buffer unsolicited result codes in the TA when TA-TE link is reserved (e.g. in on-line data mode) and flush them to the TE after reservation. Otherwise forward them directly to the TE.

#### <mt>

The rules for storing received SMS depend on its data coding scheme, preferred memory storage ([AT+CPMS](#)) setting and this value:

- 0 – No SMS-DELIVER indications are routed to the TE.
- 1 – If SMS-DELIVER is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CMTI: <mem3>,<index>.
- 2 – SMS-DELIVERs (except class 2 messages and messages in the message waiting indication group (store message)) are routed directly to the TE using unsolicited result code:  
+CMT:[<alpha>],<length><CR><LF><pdu> (PDU mode enabled); or  
+CMT:<oa>,[<alpha>],<scts>[,<tooa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>]<CR><LF><data>  
(text mode enabled, about parameters in italics, refer command Show Text Mode Parameters [AT+CSDH](#)).  
3 – Class 3 SMS-DELIVERs are routed directly to TE using unsolicited result codes defined in <mt>=2. Messages of other data coding schemes result in indication as defined in <mt>=1.

#### <bm>

The rules for storing received CBMs depend on its data coding scheme, the setting of Select CBM Types ([AT+CSCB](#)) and this value:

- 0 – No CBM indications are routed to the TE.
- 2 – New CBMs are routed directly to the TE using unsolicited result code:  
+CBM: <length><CR><LF><pdu> (PDU mode enabled); or  
+CBM: <sn>,<mid>,<dcs>,<page>,<pages><CR><LF><data> (text mode enabled)

#### <ds>

- 0 – No SMS-STATUS-REPORTs are routed to the TE.
- 1 – SMS-STATUS-REPORTs are routed to the TE using unsolicited result code:  
+CDS: <length><CR><LF><pdu> (PDU mode enabled); or  
+CDS: <fo>,<mr>,[<ra>],[<tora>],<scts>,<dt>,<st> (text mode enabled)
- 2 – If SMS-STATUS-REPORT is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CDSI: <mem3>,<index>.

#### <bfr>

- 0 – TA buffer of unsolicited result codes defined within this command is flushed to the TE when <mode> 1 to 3 is entered (OK response shall be given before flushing the codes).
- 1 – TA buffer of unsolicited result codes defined within this command is cleared when <mode> 1 to 3 is entered.

## Examples

**AT+CNMI?**

```
+CNMI: 0,0,0,0,0
OK
AT+CNMI=?
+CNMI: (0,1,2),(0,1,2,3),(0,2),(0,1,2),(0,1)
OK
AT+CNMI=2,1 (unsolicited result codes after received messages.)
OK
```

## 6.10 AT+CMGL List SMS messages from preferred store

- "REC READ" received read message
- "STO UNSENT" stored unsent message
- "STO SENT" stored sent message
- "ALL" all messages

2. PDUMode:

- 0 – received unread message (i.e. new message)
- 1 – received read message
- 2 – stored unsent message
- 3 – stored sent message
- 4 – all messages

<index>

Integer type; value in the range of location numbers supported by the associated memory.

<oa>

Originating-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <ooa>.

<da>

Destination-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <oda>.

<alpha>

String type alphanumeric representation of <da> or <oa> corresponding to the entry found in MT

phonebook; implementation of this feature is manufacturer specific; used character set should be the one selected with command Select TE Character Set [AT+CSCS](#).

<scts>

TP-Service-Centre-Time-Stamp in time-string format (refer [<dt>](#)).

<tooa>

TP-Originating-Address, Type-of-Address octet in integer format. (default refer [<toda>](#)).

<toda>

TP-Destination-Address, Type-of-Address octet in integer format. (when first character of [<da>](#) is + (IRA43) default is 145, otherwise default is 129).

<length>

Integer type value indicating in the text mode ([AT+CMGF=1](#)) the length of the message body [<data>](#) in characters; or in PDU mode ([AT+CMGF=0](#)), the length of the actual TP data unit in octets. (i.e. the RP layer SMSC address octets are not counted in the length)

<data>

In the case of SMS: TP-User-Data in text mode responses; format:

1. If [<dcs>](#) indicates that GSM 7 bit default alphabet is used and [<fo>](#) indicates that TP-User-Data-Header-Indication is not set:
  - a. If TE character set other than "HEX": ME/TA converts GSM alphabet into current TE character set.
  - b. If TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number. (e.g. character Π (GSM 7 bit default alphabet 23) is presented as 17 (IRA49 and 55))
2. If [<dcs>](#) indicates that 8-bit or UCS2 data coding scheme is used, or [<fo>](#) indicates that TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadeciml number. (e.g. octet with integer value 42 is presented to TE as two characters 2A(IRA50 and 65))
3. If [<dcs>](#) indicates that GSM 7 bit default alphabet is used:
  - a. If TE character set other than "HEX":ME/TA converts GSM alphabet into current TE character set.
  - b. If TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadeciml number.
4. If [<dcs>](#) indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadeciml number.

<oa>

Originating-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <toda>.

<alpha>

String type alphanumeric representation of <da> or <oa> corresponding to the entry found in MT phonebook; implementation of this feature is manufacturer specific; used character set should be the one selected with command Select TE Character Set **AT+CSCS**.

<scts>

TP-Service-Centre-Time-Stamp in time-string format (refer <dt>).

<tooa>

TP-Originating-Address, Type-of-Address octet in integer format. (default refer <toda>).

<fo>

Depending on the Command or result code: first octet of GSM 03.40 SMS-DELIVER, SMS-SUBMIT (default 17), SMS-STATUS-REPORT, or SMS-COMMAND (default 2) in integer format. SMS status report is supported under text mode if <fo> is set to 49.

<pid>

Protocol Identifier

GSM 03.40 TP-Protocol-Identifier in integer format

0...255

<dcs>

Depending on the command or result code: SMS Data Coding Scheme (default 0), or Cell Broadcast Data Coding Scheme in integer format.

<sca>

RP SC address Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address

given by <tosca>.

<tosca>

RP SC address Type-of-Address octet in integer format (default refer <toda>).

<length>

Integer type value indicating in the text mode (**AT+CMGF=1**) the length of the message body <data> > (or <cdata>) in characters; or in PDU mode (**AT+CMGF=0**), the length of the actual TP data unit in octets. (i.e. the RP layer SMSC address octets are not counted in the length).

<data>

In the case of SMS: TP-User-Data in text mode responses; format:

- 1 – If <dcs> indicates that GSM 7 bit default alphabet is used and <fo> indicates that TP-User-Data-Header-Indication is not set:
  - a. If TE character set other than "HEX": ME/TA converts GSM alphabet into current TE character set.
  - b. If TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number. (e.g. character Π (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55)).
- 2 – If <dcs> indicates that 8-bit or UCS2 data coding scheme is used, or <fo> indicates that TP-User-Data-Header-Indication is set: MET/A converts each 8-bit octet into two IRA character long hexadecimal number. (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65)).
- 3 – If <dcs> indicates that GSM 7 bit default alphabet is used:
  - a. If TE character set other than "HEX": ME/TA converts GSM alphabet into current TE character set.
  - b. If TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number.
- 4 – If <dcs> indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number.

<da>

Destination-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <toda>.

<toda>

TP-Destination-Address, Type-of-Address octet in integer format. (when first character of <da> is + (IRA 43) default is 145, otherwise default is 129).

<vp>

Depending on SMS-SUBMIT <fo> setting: TP-Validity-Period either in integer format (default 167) or in time-string format (refer <dt>).

<mr>

Message Reference

GSM 03.40 TP-Message-Reference in integer format.

<ra>

Recipient Address

### Defined values

<index>

Integer type, value in the range of location numbers supported by the associated memory.

<da>

Destination-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <toda>.

<toda>

TP-Destination-Address, Type-of-Address octet in integer format. (when first character of <da> is + (IRA43) default is 145, otherwise default is 129).

<text>

Content of message.

<pducontent>

Content of message.

## Defined values

<zoom>

Range is 0-91 (0 is the lowest, 91 is the highest).

<zmin>

The minimum of zoom for current dimension.

<zmax>

The maximum of zoom for current dimension.

<zcurrent>

The current zoom value.

### NOTE

1. Before set the zoom for camera, please check response of command (AT+CCAMSETZ=?). Current value will be set <zmax> instead of your set if <zoom> out of current range limits.
2. <zmax> is different to each image dimension.

## Examples

```
AT+CCAMSETZ=?  
+CCAMSETZ:(0-30)(0)  
OK  
AT+CCAMSETZ=15  
OK
```

## 7.10 AT+CCAMTP Take picture

## Description

The command is used to take a picture after camera is started and setting parameters if need.

**NOTE** [AT+CCAMTP](#) is used to take a picture, but not save; and [AT+CCAMEP](#) is used to save the picture after [AT+CCAMTP](#) execution. If [AT+CCAMTP](#) is executed more times continuously, [AT+CCAMEP](#) will save the picture which is taken by the last [AT+CCAMTP](#).

**NOTE** If GPS is running and fixed already, the GPS information (include latitude, longitude, altitude and Date-Time) will store in JPEG EXIF tab when taking picture.

SIM PIN	References

## 9 Network Service Related Commands

### 9.1 AT+CREG Network registration

#### Description

Write command controls the presentation of an unsolicited result code +CREG: <stat> when <n>=1 and there is a change in the ME network registration status.

Read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the ME.

## 9.2 AT+COPS Operator selection

### Description

Write command forces an attempt to select and register the GSM/UMTS network operator. *<mode>* is used to select whether the selection is done automatically by the ME or is forced by this command to operator *<oper>* (it shall be given in format *<format>*). If the selected operator is not available, no other operator shall be selected (except *<mode>*=4). The selected operator name format shall apply to further read commands (*AT+COPS?*) also. *<mode>*=2 forces an attempt to deregister from the network. The selected mode affects to all further network registration (e.g. after *<mode>*=2, ME shall be unregistered until *<mode>*=0 or 1 is selected).

Read command returns the current mode and the currently selected operator. If no operator is selected, *<format>* and *<oper>* are omitted.

Test command returns a list of quadruplets, each representing an operator present in the network. Quadruplet consists of an integer indicating the availability of the operator *<stat>*, long and short alphanumeric format of the name of the operator, and numeric format representation of the operator. Any of the formats may be unavailable and should then be an empty field. The list of operators shall be in order: home network, networks referenced in SIM, and other networks.

It is recommended (although optional) that after the operator list TA returns lists of supported *<mode>*s and *<format>*s. These lists shall be delimited from the operator list by two commas.

## 9.3 AT+CLCK Facility lock

### Description

The command is used to lock, unlock or interrogate a ME or a network facility `<fac>`. Password is normally needed to do such actions. When querying the status of a network service (`<mode>=2`) the response line for 'not active' case (`<status>=0`) should be returned only if service is not active for any `<class>`.

SIM PIN	References

#### `<classX>`

It is a sum of integers each representing a class of information (default 7):

- 1 – voice (telephony)
- 2 – data (refers to all bearer services)
- 4 – fax (facsimile services)
- 8 – short message service
- 16 – data circuit sync
- 32 – data circuit async
- 64 – dedicated packet access
- 128 – dedicated PAD access
- 255 – The value 255 covers all classes

## Examples

"AB" All Barring services

<oldpwd>

String type, it shall be the same as password specified for the facility from the ME user interface or with command Change Password [AT+CPWD](#).

<newpwd>

String type, it is the new password; maximum length of password can be determined with [<pwdlength>](#).

<pwdlength>

Integer type, max length of password.

## Examples

AT+CPWD=?

## 9.5 AT+CLIP Calling line identification presentation

### Description

The command refers to the GSM/UMTS supplementary service CLIP (Calling Line Identification Presentation) that enables a called subscriber to get the calling line identity (CLI) of the calling party when receiving a mobile terminated call.

Write command enables or disables the presentation of the CLI at the TE. It has no effect on the execution of the supplementary service CLIP in the network.

When the presentation of the CLI at the TE is enabled (and calling subscriber allows), +CLIP: <number>,<type>,,[,<alpha>][,<CLI validity>] response is returned after every RING (or +CRING: <type>; refer sub clause "Cellular result codes +CRC") result code sent from TA to TE. It is manufacturer specific if this response is used when normal voice call is answered.

SIM PIN	References

## Defined values

### <n>

Parameter sets/shows the result code presentation status in the TA:

- 0 – disable
- 1 – enable

### <m>

- 0 – CLIP not provisioned
- 1 – CLIP provisioned
- 2 – unknown (e.g. no network, etc.)

### <number>

String type phone number of calling address in format specified by <type>.

<type>

Type of address octet in integer format;

128 – Restricted number type includes unknown type and format

145 – International number type

129 – Otherwise

<alpha>

String type alphanumeric representation of <number> corresponding to the entry found in phone book.

<CLI validity>

0 – CLI valid

1 – CLI has been withheld by the originator

2 – CLI is not available due to interworking problems or limitations of originating network

## Examples

*AT+CLIP=1*

*OK*

*RING (with incoming call)*

*+CLIP: "02152063113",128,,,"gongsi",0*

## 9.6 AT+CLIR Calling line identification restriction

### Description

The command refers to CLIR-service that allows a calling subscriber to enable or disable the presentation of the CLI to the called party when originating a call.

Write command overrides the CLIR subscription (default is restricted or allowed) when temporary mode is provisioned as a default adjustment for all following outgoing calls. This adjustment can be revoked by using the opposite command.. If this command is used by a subscriber without provision of CLIR in permanent mode the network will act.

Read command gives the default adjustment for all outgoing calls (given in <n>), and also triggers an interrogation of the provision status of the CLIR service (given in <m>).

Test command returns values supported as a compound value.

## 9.7 AT+COLP Connected line identification presentation

### Description

The command refers to the GSM/UMTS supplementary service COLP(Connected Line Identification Presentation) that enables a calling subscriber to get the connected line identity (COL) of the called party after setting up a mobile originated call. The command enables or disables the presentation of the COL at the TE. It has no effect on the execution of the supplementary service COLR in the network.

When enabled (and called subscriber allows), +COLP:<number>, <type> [,<subaddr>, <satype> ,<alpha>]] intermediate result code is returned from TA to TE before any +CR responses.

0 – unconditional
1 – mobile busy
2 – no reply
3 – not reachable
4 – all call forwarding
5 – all conditional call forwarding

<mode>
0 – disable
1 – enable
2 – query status
3 – registration
4 – erasure

**<number>**

String type phone number of forwarding address in format specified by **<type>**.

**<type>**

Type of address octet in integer format:

- 145 – dialing string **<number>** includes international access code character ‘+’
- 129 – otherwise

**<subaddr>**

String type sub address of format specified by **<satype>**.

**<satype>**

Type of sub address octet in integer format, default 128.

**<classX>**

It is a sum of integers each representing a class of information (default 7):

- 1 – voice (telephony)
- 2 – data (refers to all bearer services)
- 4 – fax (facsimile services)
- 16 – data circuit sync
- 32 – data circuit async
- 64 – dedicated packet access
- 128 – dedicated PAD access
- 255 – The value 255 covers all classes

**<time>**

1...30 – when "no reply" is enabled or queried, this gives the time in seconds to wait before call is forwarded, default value 20.

**<status>**

- 0 – not active
- 1 – active

## Examples

```

## 9.10 AT+CCWA Call waiting

### Description

The command allows control of the Call Waiting supplementary service. Activation, deactivation and status query are supported. When querying the status of a network service (`<mode>=2`) the response line for 'not active' case (`<status>=0`) should be returned only if service is not active for any `<class>`. Parameter `<n>` is used to disable/enable the presentation of an unsolicited result code +CCWA: `<number>,<type>,<class>,[<alpha>][,<CLI validity>]` to the TE when call waiting service is enabled. Command should be abortable when network is interrogated.

**<number>**

String type phone number of calling address in format specified by [\*\*<type>\*\*](#).

**<type>**

Type of address octet in integer format;

```

128 – Restricted number type includes unknown type and format
145 – International number type
129 – Otherwise
  
```

**<alpha>**

Optional string type alphanumeric representation of <number> corresponding to the entry found in phonebook; used character set should be the one selected with command Select TE Character Set [\*\*AT+CSCS\*\*](#).

**<CLI validity>**

```

0   – CLI valid
1   – CLI has been withheld by the originator.

## 9.11 AT+CHLD Call related supplementary services

### Description

The command allows the control of the following call related services:

1. A call can be temporarily disconnected from the ME but the connection is retained by the network.
  2. Multiparty conversation (conference calls).
  3. The served subscriber who has two calls (one held and the other either active or alerting) can connect the other parties and release the served subscriber's own connection.
- Calls can be put on hold, recovered, released, added to conversation, and transferred.

```

## 9.12 AT+CUSD Unstructured supplementary service data

### Description

The command allows control of the Unstructured Supplementary Service Data (USSD). Both network and mobile initiated operations are supported. Parameter `<n>` is used to disable/enable the presentation of an unsolicited result code (USSD response from the network, or network initiated operation) +CUSD: `<m>[,<str>,<dcs>]` to the TE. In addition, value `<n>=2` is used to cancel an ongoing USSD session.

0	– disable the result code presentation in the TA
1	– enable the result code presentation in the TA
2	– cancel session (not applicable to read command response)
<code>&lt;str&gt;</code>	
String type USSD-string.	
<code>&lt;dcs&gt;</code>	
Cell Broadcast Data Coding Scheme in integer format (default 0).	
<code>&lt;m&gt;</code>	
0	– no further user action required (network initiated USSD-Notify, or no further information needed after mobile initiated operation)
1	– further user action required (network initiated USSD-Request, or further information

- needed after mobile initiated operation)
- 2 – USSD terminated by network
  - 4 – operation not supported
  - 5 – network time out

## 9.13 AT+CAOC Advice of charge

### Description

The refers to Advice of Charge supplementary service that enables subscriber to get information about the cost of calls. With `<mode>=0`, the execute command returns the current call meter value from the ME.

The command also includes the possibility to enable an unsolicited event reporting of the CCM information. The unsolicited result code +CCCM: `<ccm>` is sent when the CCM value changes, but not more than every 10 seconds. Deactivation of the unsolicited event reporting is made with the same command.

## Defined values

<mode>

- 0 – query CCM value
- 1 – deactivate the unsolicited reporting of CCM value
- 2 – activate the unsolicited reporting of CCM value

<ccm>

String type, three bytes of the current call meter value in hexadecimal format (e.g. "00001E" indicates decimal value 30), value is in home units and bytes are similarly coded as ACMmax value in the SIM.

## Examples

```
AT+CAOC=0
+CAOC: "000000"
OK
```

## 9.14 AT+CSSN Supplementary service notifications

### Description

The command refers to supplementary service related network initiated notifications. The set command enables/disables the presentation of notification result codes from TAto TE.

When <n>=1 and a supplementary service notification is received after a mobile originated call setup, intermediate result code +CSSI: <code1>[,<index>] is sent to TE before any other MO call setup result codes presented in the present document. When several different <code1>s are received from the network, each of them shall have its own +CSSI result code.

When <m>=1 and a supplementary service notification is received during a mobile terminated call setup or during a call, or when a forward check supplementary service notification is received, unsolicited result code +CSSU: <code2>[,<index>[,<number>,<type>[,<subaddr>,<stype>]]] is sent to TE. In case of MT call setup, result code is sent after every +CLIP result code (refer command "Calling line identification presentation +CLIP") and when several different <code2>s are received from the network, each of them shall have its own +CSSU result code.

### <code1>

- 0 – unconditional call forwarding is active
- 1 – some of the conditional call forwarding are active
- 2 – call has been forwarded
- 3 – call is waiting
- 5 – outgoing calls are barred

### <index>

Refer "Closed user group +CCUG".

### <code2>

- 0 – this is a forwarded call (MT call setup)
- 2 – call has been put on hold (during a voice call)
- 3 – call has been retrieved (during a voice call)
- 5 – call on hold has been released (this is not a SS notification) (during a voice call)

### <number>

String type phone number of format specified by <type>.

### <type>

Type of address octet in integer format; default 145 when dialing string includes international access code character "+", otherwise 129.

### <subaddr>

String type sub address of format specified by <satype>.

### <satype>

Type of sub address octet in integer format, default 128.

- 1 – Enable automatic time zone update via NITZ.

**NOTE** 1. The value of <onoff> is nonvolatile, and factory value is 0.

2. For automatic time and time zone update is enabled (+CTZU=1):

If time zone is only received from network and it doesn't equal to local time zone (AT+CCLK), time zone is updated automatically, and real time clock is updated based on local time and the difference between time zone from network and local time zone (Local time zone must be valid).

If Universal Time and time zone are received from network, both time zone and real time clock is updated automatically, and realtime clock is based on Universal Time and time zone from network.

## Examples

```
AT+CTZU?
```

```
+CTZU: 0
```

```
OK
```

```
AT+CTZU=1
```

```
OK
```

## 9.25 AT+CTZR Time and time Zone Reporting

### Description

The command is used to enable and disable the time zone change event reporting. If the reporting is enabled the MT returns the unsolicited result code +CTZV: <tz>[,<time>][,<dst>] whenever the time zone is changed.

**NOTE** The time zone reporting is not affected by the Automatic Time and Time Zone command AT+CTZU.

## Defined values

<onoff>

Integer type value indicating:

- 0 – Disable time zone change event reporting (default).
- 1 – Enable time zone change event reporting.

+CTZV: <tz>[,<ime>][,<dst>]

Unsolicited result code when time zone received from network doesn't equal to local time zone, and if the informations from network don't include date and time, time zone will be only reported, and if network daylight saving time is present, it is also reported. For example:

- +CTZV: 32 (*Only report time zone*)
- +CTZV: 32,1 (*Report time zone and network daylight saving time*)
- +CTZV: 32,08/12/09,17:00:00 (*Report time and time zone*)
- +CTZV: 32,08/12/09,17:00:00,1 (*Report time, time zone and daylight saving time*)

For more detailed informations about time and time zone, please refer 3GPP TS 24.008.

<tz> Local time zone received from network.

<ime> Universal time received from network, and the format is “yy/MM/dd, hh:mm:ss”, where characters indicate year (two last digits), month, day, hour, minutes and seconds.

<dst> Network daylight saving time, and if it is received from network, it indicates the value that has been used to adjust the local time zone. The values as following:

- 0 – No adjustment for Daylight Saving Time.
- 1 – +1 hour adjustment for Daylight Saving Time.
- 2 – +2 hours adjustment for Daylight Saving Time.

**NOTE** Herein, <ime> is Universal Time or NITZ time, but not local time.

## 10 Mobile Equipment Control and Status Commands

### 10.1 +CME ERROR Mobile Equipment error result code

#### Description

The operation of +CME ERROR:<err> result code is similar to the regular ERROR result code: if +CME ERROR: <err> is the result code for any of the commands in a command line, none of the following commands in the same command line is executed (neither ERROR nor OK result code shall be returned as a result of a completed command line execution). The format of <err> can be either numeric or verbose. This is set with command [AT+CMEE](#).

## 10.4 AT+CFUN Set phone functionality

### Description

The command selects the level of functionality **<fun>** in the ME. Level "full functionality" is where the highest level of power is drawn. "Minimum functionality" is where minimum power is drawn. Level of functionality between these may also be specified by manufacturers. When supported by manufacturers, ME resetting with **<rst>** parameter may be utilized.

**NOTE** AT+CFUN=6 must be used after setting AT+CFUN=7.

4 – disable phone both transmit and receive RF circuits
5 – Factory Test Mode
6 – Reset
7 – Offline Mode

<rst>

- 0 – do not reset the ME before setting it to <fun> power level
- 1 – reset the ME before setting it to <fun> power level

## Examples

```
AT+CFUN?
+CFUN: 1
OK
AT+CFUN=0
OK
```

## 10.5 AT+CPIN Enter PIN

### Description

The command sends to the ME a password which is necessary before it can be operated (SIM PIN, SIM PUK, PH-SIM PIN, etc.). If the PIN is to be entered twice, the TA shall automatically repeat the PIN. If no PIN request is pending no action is taken towards MT and an error message, +CME b is returned to TE.

If the PIN required is SIM PUK or SIM PUK2, the second pin is required. This second pin, <newpin>, is used to replace the old pin in the SIM.

## 10.10 AT+CPUC Price per unit and currency table

### Description

The command sets the parameters of Advice of Charge related price per unit and currency table in SIM file EPUCT.

SIM PIN	References
YES	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CPUC=?	OK
Read Command	Responses
AT+CPUC?	+CPUC: [<currency>,<ppu>] OK ERROR +CME ERROR: <err>
Write Command	Responses
AT+CPUC=<currency>,<ppu>[,<passwd>]	OK ERROR +CME ERROR: <err>

## Defined values

<currency>

String type, three-character currency code (e.g. "GBP", "DEM"), character set as specified by command Select TE Character Set [AT+CSCS](#).

<ppu>

String type, price per unit, dot is used as a decimal separator (e.g. "2.66").

<passwd>

String type, SIM PIN2.

## Examples

*AT+CPUC?*

+CPUC: "GBP",2.66

*OK*

## 10.11 AT+CPOF Control phone to power down

### Description

The command controls the phone to power off.

AT+CPOF	OK

## Examples

*AT+CPOF*

*OK*

## 10.12 AT+CCLK Real time clock

### Description

The command is used to manage Real Time Clock of the module.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CCLK=?	OK

Read Command	Responses
AT+CCLK?	+CCLK: <time> OK
Write Command	Responses
AT+CCLK=<time>	OK ERROR

## Defined values

<time>

String type value; format is “yy/MM/dd, hh:mm:ss±zz”, where characters indicate year (two last digits), month, day, hour, minutes, seconds and time zone (indicates the difference, expressed in quarters of an hour, between the local time and GMT; three last digits are mandatory, range -47...+48). E.g. 6<sup>th</sup> of May 2008, 14:28:10 GMT+8 equals to “08/05/06,14:28:10+32”.

- NOTE**
1. Time zone is nonvolatile, and the factory value is invalid time zone.
  2. Command **+CCLK?** will return time zone when time zone is valid, and if time zone is 00, command **+CCLK?** will return “+00”, but not “-00”.

## Examples

```
AT+CCLK="08/11/28, 12:30:33+32"
OK
AT+CCLK?
+CCLK: "08/11/28,12:30:35+32"
OK
AT+CCLK="08/11/26,10:15:00"
OK
AT+CCLK?
+CCLK: "08/11/26,10:15:02+32"
OK
```

## 10.13 AT+CRFEN RF check at initialization

### Description

The command will enable or disable RF check at the initialization, you can disable the RF control status check at the initialization if do not want to check the RF pin status. This status will be saved the check function on reboot.

SIM PIN	References

## Defined values

<value>
0 – disable RF check at initialization
1 – enable RF check at initialization

## Examples

```
AT+CRFEN=1
OK
AT+CRFEN?
+CRFEN: 1
OK
AT+CRFEN=?
+CRFEN: (0-1)
OK
```

## 10.14 AT+CRESET Reset ME

### Description

The command is used to reset ME.

SIM PIN	References
NO	Vendor

### Syntax

### Syntax

Test Command	Responses
AT+SIMEI=?	OK
Read Command	Responses
AT+SIMEI?	+SIMEI: <imei> OK
Write Command	Responses
AT+SIMEI=<imei>	OK ERROR

### Defined values

<imei>

The 15-digit IMEI value.

### Examples

```
AT+SIMEI=357396012183170
```

*OK*

```
AT+SIMEI?
```

+SIMEI: 357396012183170

*OK*

```
AT+SIMEI=?

## Defined values

<facility>	
“PN”	Network Personalisation
“PU”	Network subset Personalisation
“PP”	Service Provider Personalisation
“PC”	Corporate Personalisation
“PF”	Lock Phone to the very First SIM card
<old password>	Password specified for the facility. The length of password is 8.
<new password>	New password for the facility. The length of password is 8.
<PN_status>	Status of “PN” lock
0	inactive
1	autolock
2	active
5	disable
<PU_status>	Status of “PU” lock
0	inactive

1	autolock

Write Command	Responses
AT+DSWITCH=<mode>	OK ERROR

## Defined values

### <mode>

Pamameter shows the settings of diagnostics port

- 0      Switch from data mode to debug mode
- 1      Switch from debug mode to data mode

## Examples

```
AT+DSWITCH=?
```

```
+DSWITCH: (0-1)
```

```
OK
```

```
AT+DSWITCH?

## 11 SIM Related Commands

### 11.1 AT+CICCID Read ICCID in SIM card

#### Description

The command is used to Read the ICCID in SIM card

SIM PIN	References
YES	Vendor

#### Syntax

Test Command	Responses
AT+CICCID=?	OK
Execution Command	Responses
AT+CICCID	+ICCID:<ICCID> OK
	ERROR
	+CME ERROR: <err>

#### Defined values

<ICCID>

Integrate circuit card identity, a standard ICCID is a 20-digit serial number of the SIM card, it presents the publish state, network code, publish area, publish date, publish manufacture and press serial number of the SIM card.

#### Examples

```
AT+CICCID
+ICCID: 898600700907A6019125
OK
```

### 11.2 AT+CSIM Generic SIM access

#### Description

The command allows to control the SIM card directly.

Compared to restricted SIM access command [AT+CRSM](#), [AT+CSIM](#) allows the ME to take more control over the SIM interface.

For SIM-ME interface please refer 3GPP TS 11.11.

**NOTE** The SIM Application Toolkit functionality is not supported by [AT+CSIM](#). Therefore the following SIM commands can not be used: [TERMINAL PROFILE](#), [ENVELOPE](#), [FETCH](#) and [TERMINAL RESPONSE](#).

SIM PIN	References
YES	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CSIM=?	OK
Write Command	Responses
AT+CSIM=	+CSIM: <length>, <response>
<length>, <command>	OK
	ERROR
	+CME ERROR: <err>

## Defined values

<length>

Integer type; length of the characters that are sent to TE in <command> or <response>

<command>

Command passed on by the MT to the SIM.

<response>

Response to the command passed on by the SIM to the MT.

## Examples

AT+CSIM=?

OK

## 11.3 AT+CRSM Restricted SIM access

### Description

By using **AT+CRSM** instead of Generic SIM Access **AT+CSIM**, TE application has easier but more limited access to the SIM database.

Write command transmits to the MT the SIM **<command>** and its required parameters. MT handles internally all SIM-MT interface locking and file selection routines. As response to the command, MT sends the actual SIM information parameters and response data. MT error result code +CME ERROR may be returned when the command cannot be passed to the SIM, but failure in the execution of the command in the SIM is reported in **<sw1>** and **<sw2>** parameters.

SIM PIN	References
YES	3GPP TS 27.007

## Syntax

Test Command	Responses
AT+CRSM=?	OK
Write Command	Responses
AT+CRSM=<command> [,<fileID>[,<p1>,<p2>,<p3> [,<data>]]]	+CRSM: <sw1>,<sw2>[,<response> OK ERROR +CME ERROR: <err>

## Defined values

### <command>

Command passed on by the MT to the SIM:

- 176 – READ BINARY
- 178 – READ RECORD
- 192 – GET RESPONSE
- 214 – UPDATE BINARY
- 220 – UPDATE RECORD
- 242 – STATUS
- 203 – RETRIEVE DATA
- 219 – SET DATA

### <fileID>

Identifier for an elementary data file on SIM, if used by <command>.

### <p1> <p2> <p3>

Integer type; parameters to be passed on by the Module to the SIM.

### <data>

Information which shall be written to the SIM(hexadecimal character format, refer **AT+CSCS**).

### <sw1> <sw2>

Status information from the SIM about the execution of the actual command. It is returned in both cases, on successful or failed execution of the command.

### <response>

Response data in case of a successful completion of the previously issued command  
 “STATUS” and “GET RESPONSE” commands return data, which gives information about the currently selected elementary data field. This information includes the type of file and its size.  
 After “READ BINARY” or “READ RECORD” commands the requested data will be returned.  
 <response> is empty after “UPDATE BINARY” or “UPDATE RECORD” commands.

## Examples

*AT+CRSM=?*

*OK*

## 11.4 AT+CSIMSEL Switch between two SIM card

### Description

The command is used to select external or embedded SIM card.

- NOTE**
1. Embedded SIM card supported by customization. Customer should provide information written into USIM chipset.
  2. The command is disabled if the embedded SIM card isn't exist, i.e. standard hardware version.

### Defined values

<detect>

- 0 – LEVEL trigger mode
- 1 – EDGE trigger mode

<polarity>

- 0 – trigger when low level
- 1 – trigger when high level

<save>

- 0 – not save the setting
- 1 – save the setting

**NOTE** If the parameter of <save> is omitted, it will save the setting.

### Examples

*AT+CGPIO=1,1,0*

*OK*

## 12.13 AT+CGDRT Set the direction of specified GPIO

### Description

The command is used to set the specified GPIO to in or out state. If setting the specified GPIO to in state, then it can not set the value of the GPIO to high or low.

SIM PIN	References

5 – GPIO5
<gpio_io>
0 – in
1 – out
<save>
0 – not save the setting
<u>1</u> – save the setting

**NOTE** If the parameter of <save> is omitted, it will save the direction of specified GPIO.

### Examples

AT+CGDRT=3,0,0
OK

## 12.14 AT+CGSETV Set the value of specified GPIO

### Description

The command is used to set the value of the specified GPIO to high or low.

SIM PIN	References

3 – GPIO3  
5 – GPIO5

<gpio\_hl>

0 – low  
1 – high

<save>

0 – not save the setting  
1 – save the setting

**NOTE** If the parameter of <save> is omitted, it will save the value of specified GPIO.

## Examples

AT+CGSETV=3,0,0

OK

## 12.15 AT+CGGETV Get the value of specified GPIO

### Description

The command is used to get the value(hight or low) of the specified GPIO.

SIM PIN References

### Defined values

<adc>
ADC type:
0 - rawtype.
1 - temperature type.

<value>

Integer type value of the ADC.

## Examples

```
AT+CADC=?
+CADC:(0-1)
OK
```

## 12.17 AT+CMICAMP1 Set value of micamp1

### Description

The command is used to set audio path parameter – micamp1; this is different with [AT +CMIC](#). With this command you can change the first stage of MIC amplify value based on your design separately and refer to related hardware design document to get more information

SIM PIN	References

Write Command	Responses
AT+CVLVL=<lvl>, <lvl_value>	OK ERROR

### Defined values

<lvl>	sound level number which is from 1 to 4.
<lvl_value>	sound level value which is from -5000 to 5000.
<lvl_value1>	sound level value that sound level number equals 1.
<lvl_value2>	sound level value that sound level number equals 2.
<lvl_value3>	sound level value that sound level number equals 3.
<lvl_value4>	

sound level value that sound levelnumber equals 4.

## Examples

```
AT+CVLVL=1,-2000
+CVLVL: -2000
OK
AT+CVLVL?
+CVLVL: -2000,-200,500,1000
OK
AT+ CVLVL=?

## 13 Phonebook Related Commands

### 13.1 AT+CNUM Subscriber number

#### Description

Execution command returns the MSISDNs related to the subscriber (this information can be stored in the SIM or in the ME). If subscriber has different MSISDN for different services, each MSISDN is returned in a separate line.

SIM PIN	References
YES	3GPP TS 27.007

#### Defined values

<alpha>

Optional alphanumeric string associated with <number>, used character set should be the one selected with command Select TE Character Set [AT+CSCS](#).

<number>

String type phone number of format specified by <type>.

<type>

Type of address octet in integer format. see also [AT+CPBR <type>](#)

#### Examples

```
AT+CNUM
+CNUM: , "13697252277", 129
OK
```

### 13.2 AT+CPBS Select phonebook memory storage

#### Description

The command selects the active phonebook storage, i.e. the phonebook storage that all subsequent phonebook commands will be operating on.

### <storage>

Values reserved by the present document:

"DC"	ME dialed calls list Capacity: max. 10 entries  AT+CPBW command is not applicable to this storage.
"MC"	ME missed (unanswered received) calls list Capacity: max. 10 entries  AT+CPBW command is not applicable to this storage.
"RC"	ME received calls list Capacity: max. 10 entries  AT+CPBW command is not applicable to this storage.
<u>"SM"</u>	SIM phonebook Capacity: depending on SIM card
"ME"	Mobile Equipment phonebook Capacity: max. 100 entries
"FD"	SIM fix dialling-phonebook Capacity: depending on SIM card

"ON"	MSISDN list Capacity: depending on SIM card
"LD"	Last number dialed phonebook Capacity: max. 10 entries  <b>AT+CPBW</b> command is not applicable to this storage.
"EN"	Emergency numbers Capacity: max. 50 entries  <b>AT+CPBW</b> command is not applicable to this storage.
<used>	Integer type value indicating the number of used locations in selected memory.
<total>	Integer type value indicating the total number of locations in selected memory.

## Examples

```

AT+CPBS=?
+CPBS: ('SM','DC','FD','LD','MC','ME','RC','EN','ON')

## Defined values

### [`<findtext>`](#)

String type, this value is used to find the record. Character set should be the one selected with command [AT+CSCS](#).

### [`<index>`](#)

Integer type values in the range of location numbers of phonebook memory.

### [`<number>`](#)

String type, phone number of format [`<type>`](#), the maximum length is [`<nlength>`](#).

### [`<type>`](#)

Type of phone number octet in integer format, default 145 when dialing string includes international access code character "+", otherwise 129.

### [`<text>`](#)

String type field of maximum length [`<tlength>`](#); Often this value is set as name.

### [`<nlength>`](#)

Integer type value indicating the maximum length of field [`<number>`](#).

### [`<tlength>`](#)

Integer type value indicating the maximum length of field [`<text>`](#).

## Examples

```
AT+CPBF="James "
+CPBF: 1,"1234567890",129,"James "
```

*OK*

## 13.5 AT+CPBW Write phonebook entry

### Description

The command writes phonebook entry in location number <index> in the current phonebook memory storage selected with [AT+CPBS](#).

SIM PIN	References
YES	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CPBW=?	+CPBW:(list of supported <index>s),[<nlength>], (list of supported <type>s),[<tlength>] OK
	+CME ERROR:<err>
Write Command	Responses
AT+CPBW=[<index>][, <number>[,<type>[,<text>]]]	OK ERROR +CME ERROR:<err>

### Defined values

<index>

Integer type values in the range of location numbers of phonebook memory. If <index> is not given, the first free entry will be used. If <index> is given as the only parameter, the phonebook entry specified by <index> is deleted. If record number <index> already exists, it will be overwritten.

<number>

String type, phone number of format <type>, the maximum length is <nlength>.

<type>

Type of address octet in integer format, default 145 when dialing string includes international access code character "+", otherwise 129.

<text>

String type field of maximum length <tlength>; character set as specified by command Select TE Character Set [AT+CSCS](#).

<nlength>

Integer type value indicating the maximum length of field <number>.

<tlength>

Integer type value indicating the maximum length of field <text>.

**NOTE** If the parameters of <type> and <text> are omitted and the first character of <number> is '+', it will specify <type> as 145(129 if the first character isn't '+') and <text> as NULL.

## Examples

```
AT+CPBW=3,"88888888",129,"John"
```

OK

```
AT+CPBW=,"6666666",129,"mary"
```

OK

```

## 13.6 AT+CEMNLIST set the list of emergency number

### Description

The command allows to define emergency numbers list according to customers' requirement.  
Note that only no sim card is inserted or sim card is locked, these emergency numbers take effect.

SIM PIN	References
NO	Vendor

### Syntax

Test Command	Responses
AT+CEMNLIST=?	+CEMNLIST: (list of supported <mode>s), <nlength>, <total> OK
Read Command	Responses
AT+CEMNLIST ?	+CEMNLIST: <mode>, <emergency numbers> OK
Write Command	Responses
AT+CEMNLIST=<mode>[,<emergency numbers>]	OK

### Defined values

#### <mode>

- 0 disable
- 1. enable
- 2 edit emergency numbers

#### <nlength>

Integer type value indicating the maximum length of single emergency number.

#### <total>

Integer type value indicating the total number of emergency numbers.

<emergency numbers>

Emergency numbers list, string type.

<emergency number> includes all of emergency numbers, every emergency number is separated by comma, for example "911,112".

## Examples

AT+CEMNLIST=?

+CEMNLIST: (0-2),10,30

OK

AT+CEMNLIST?

+CEMNLIST: 1, "911,112"

OK

AT+CEMNLIST=1

## 14 File System Related Commands

The file system is used to store files in a hierarchical (tree) structure, and there are some definitions and conventions to use the Module.

Local storage space is mapped to “**C:**”, and storage space of present storage card is mapped to “**D:**”. In both “**C:**” and “**D:**” directories, module creates four directories named “**Picture**”, “**Audio**”, “**Video**” and “**VideoCall**” automatically; “**Picture**” is used to store static image when taking picture by camera, “**Audio**” is used to store audio file, “**Video**” is used to store video file when recording by camera, and “**VideoCall**” is used to store media file which is recorded during a video call.

**NOTE** General rules for naming (both directories and files):

- 1 The length of actual fully qualified names of directories and files can not exceed 245. For example: the length of “C:/Picture/first\_image.jpg” don’t exceed 245.
- 2 Directory and file names can not include the following characters:  
  \ : \* ? “ < > |
- 3 Between directory name and file/directory name, use character “/” as list separator, so it can not appear in directory name or file name.
- 4 The first character of names must be a letter or a numeral or underline, and the lastest character can not be period “.” and oblique “/”.
- 5 Case sensitive in “**C:**”, but not case sensitive in “**D:**” if storage card is present.

### 14.1 AT+FSCD Select directory as current directory

#### Description

The command is used to select a directory. The Module supports absolute path and relative path.

Read Command will return current directory without double quotation marks.

SIM PIN	References

## Defined values

<path>

String without double quotes, directory for selection.

**NOTE** If <path> is “..”, it will go back to previous level of directory. If current directory is D:/ or in D:/ and SD card is removed and unmounted, it will set current directory C:/ automatically after a moment.

<curr\_path>

String without double quotes, current directory.

## 14.8 AT+FSMEM Check the size of available memory

### Description

The command is used to check the size of available memory. The response will list total size and used size of local storage space and SD card if present and mounted.

SIM PIN	References
NO	Vendor

### Syntax

Test Command	Responses
AT+FSMEM=?	OK
Execution Command	Responses
AT+FSMEM	+FSMEM: C:(<total>, <used>)[, D:(<total>, <used>)] OK

### Defined values

<total>

The total size of local storage space or SD card.

<used>

The total size of local storage space or SD card.

**NOTE** The unit of storage space size is in Byte.

### Examples

```
AT+FSMEM

## 14.10 AT+FSLOCA Select storage place

### Description

The command is used to set the storage place for media files. If the storage card is not present, it can not set storage place as storage card. When the Module is power on, the value of <loca> is 0.

#### NOTE

1. Static image taken by camera is stored in “C:/Picture” or “D:/Picture” directory.
2. Video file recorded by camera is stored in “C:/Video” or “D:/Video” directory.
3. Media file recorded during a video call is stored in “C:/VideoCall” or “D:/Videocall” directory.
4. Audio file recorded is stored in “C:/Audio” or “D:/Audio” directory.

## 15 File Transmission Related Commands

The module supports file transmission between the Module and PC host over Xmodem protocol, and the transmission is bidirectional.

### 15.1 AT+CTXFILE Select file transmitted to PC host

#### Description

The command is used to select a file which is transmitted from the module to PC host. After selecting the file successfully, use HyperTerminal to get the file over Xmodem protocol [refer AT Commands Samples: [File transmission to PC host](#)]. If available memory is not enough, file transmission will fail.

SIM PIN	References

AT+CTXFILE=?	+CTXFILE: (list of supported <dir_type>s) OK
Write Command	Responses
AT+CTXFILE=<file_name> [,<dir_type>[,<protocol>]]	OK FILE NOT EXISTING ERROR

#### Defined values

<filename>

String with double quotes , file name to be transmitted to PC host which is already existing.

<dir\_type>

0 – file to be transmitted is in current directory; before [AT+CTXFILE](#) execution, it needs to set current directory [refer [AT+FSCD](#)]

- 1 – file to be transmitted is in “C:/Picture” directory
- 2 – file to be transmitted is in “C:/Video” directory
- 3 – file to be transmitted is in “C:/VideoCall” directory
- 4 – file to be transmitted is in “D:/Picture” directory
- 5 – file to be transmitted is in “D:/Video” directory
- 6 – file to be transmitted is in “D:/VideoCall” directory
- 7 – file to be transmitted is in “C:/Audio” directory
- 8 – file to be transmitted is in “D:/Audio” directory

**NOTE** If <dir\_type> is omitted, it will select a file to be transmitted which is in current directory.

**AT+FSCD** and **AT+FSLS** being used in combination can help user to check the file selected whether existing or not.

## 15.2 AT+CRXFILE Set name of file received from PC host

### Description

The command is used to set file name which is received from PC host to file system of module. After setting successfully, use HyperTerminal to send the file over Xmodem protocol [refer AT Commands Samples: [File received from PChost](#)].

SIM PIN	References
NO	Vendor

### Syntax

Test Command	Responses
AT+CRXFILE=?	OK
Write Command	Responses
AT+CRXFILE=<file_name> [,<dir_type>]	OK FILE IS EXISTING ERROR

### Defined values

<file\_name>

String with double quotes, file name which is received from PC host.

<dir\_type>

Specify storage location of file which is received from PC host. If this parameter is omitted, it will save the file to current directory [refer [AT+FSCD](#)]

- 0 – save file received from PC host to current directory; before [AT+CTXFILE](#) execution, it needs to set current directory [refer [AT+FSCD](#)]
- 1 – save file to “C:/Picture” directory
- 2 – save file to “C:/Video” directory
- 3 – save file to “C:/VideoCall” directory
- 4 – save file to “D:/Picture” directory
- 5 – save file to “D:/Video” directory
- 6 – save file to “D:/VideoCall” directory
- 7 – save file to “C:/Audio” directory
- 8 – save file to “D:/Audio” directory

## 16 V24-V25 Commands

### 16.1 AT+IPR Set local baud rate temporarily

#### Description

The command sets the baud rate of module's serial interface temporarily, after reboot the baud rate is set to default value. The default value is 115200.

SIM PIN	References
NO	V.25ter

#### Syntax

Test Command	Responses
AT+IPR=?	+IPR: (list of supported <speed>s) OK
Read Command	Responses
AT+IPR?	+IPR: <speed> OK
Write Command	Responses
AT+IPR=<speed>	OK ERROR
Execution Command	Responses
AT+IPR	<i>Set default value 115200:</i> OK

#### Defined values

<speed>
Baud rate per second:
300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, <u>115200</u> , 230400, 460800, 921600,
3200000, 3686400, 4000000

#### Examples

AT+IPR?
+IPR: 115200
OK
AT+IPR=?
+IPR:(300,600,1200,2400,4800,9600,19200,38400,57600,115200,230400,460800,921600, 3200000, 3686400, 4000000)
OK

```
AT+IPR=115200
OK
```

## 16.2 AT+IPREX Set local baud rate permanently

### Description

The command sets the baud rate of module's serial interface permanently, after reboot the baud rate is also valid.

SIM PIN	References
NO	Vendor

### Syntax

Test Command	Responses
AT +IPREX=?	+IPREX: (list of supported<speed>s) OK

Execution Command	Responses
AT+IPREX	<i>Set default value 115200:</i> OK

### Defined values

<speed>
Baud rate per second:
300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, <u>115200</u> , 230400, 460800, 921600, 3200000, 3686400, 4000000

### Examples

```
AT+IPREX?
+IPREX: 115200
OK
AT+IPREX=?
+IPREX: (300,600,1200,2400,4800,9600,19200,38400,57600,115200,230400,460800,921600

### Defined values

<format>

Only support value “3” at moment:

3 – data bit 8, stop bit 1

<parity>

0 – Odd

1 – Even

2 – mark

3 – none

### Examples

```
AT+ICF?

## 17 GPS Related Commands

### 17.1 AT+CGPS Start/stop GPS session

#### Description

The command is used to start or stop GPS session.

- NOTE**
1. Output of NMEA sentences is automatic; no control via AT commands is provided. You can configure NMEA or UART port for output by using [AT+CGPSSWITCH](#). At present only support standalone mode. If executing [AT+CGPS=1](#), the GPS session will choose cold or hot start automatically.
  2. UE-based and UE-assisted mode depends on URL ([AT+CGPSURL](#)) and certificate ([AT+CGPSSL](#)). When UE-based mode failing, it will switch standalone mode.
  3. UE-assisted mode is single fix. Standalone and UE-based mode is consecutive fix.

SIM PIN	References

Write Command	Responses
AT+CGPS=<on/off> [,<mode>]	OK <i>If UE-assisted mode, when fixed will report indication:</i> +CAGPSINFO:<lat>,<lon>,<alt>,<date>,<time> ERROR

#### Defined values

<on/off>
0 – stop GPS session
1 – start GPS session
<mode>
Ignore - standalone mode 1 – standalone mode 2 – UE-based mode 3 – UE-assisted mode
<lat>
Latitude of current position. Unit is in 10^8 degree
<log>
Longitude of current position. Unit is in 10^8 degree

<alt>  
 MSL Altitude. Unit is meters.  
 <date>  
 UTC Date. Output format is ddmmyyyy  
 <time>  
 UTCTime. Output format is hhmmss.s

## Examples

```
AT+CGPS=?

### Defined values

<lat>  
 Latitude of current position. Output format is ddmm.mmmm  
 <N/S>  
 N/S Indicator, N=north or S=south  
 <log>

Longitude of current position. Output format is dddmm.mmmm

<E/W>

E/W Indicator, E=east or W=west

<date>

Date. Output format is ddmmyy

<time>

UTCTime. Output format is hhmmss.s

<alt>

MSL Altitude. Unit is meters.

<speed>

Speed Over Ground. Unit is knots.

<time>

The range is 0-255, unit is second, after set <time> will report the GPS information every the seconds.

## 17.5 AT+CGPSSWITCH Configure output port for NMEA sentence

### Description

The command is used to choose the output port for NMEA sentence.

**NOTE** Support NMEA output over the UART or NMEA port. You can choose only one port for the NMEA sentence. If choosing UART port, Baud rate of host must be set 57600 bit/s, and can't input AT commands through UART port, and the NMEA port is disabled absolutely. If choosing NMEA port for NMEA sentence, the UART port function is integrated. It takes effect after rebooting.

#### Defined values

`<cid>`  
 (PDP Context Identifier) a numeric parameter which specifies a particular PDP context definition. The parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.

1...16

**<PDP\_type>**

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol

PPP Point to Point Protocol

IPv6 Internet Protocol Version 6

**<APN>**

(Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network.

**<PDP\_addr>**

A string parameter that identifies the MT in the address space applicable to the PDP.

Read command will continue to return the null string even if an address has been allocated during the PDP start up procedure. The allocated address may be read using command [AT+CGPADDR](#).

**<d\_comp>**

A numeric parameter that controls PDP data compression:

0 – off (default if value is omitted)

1 – on

2 – V.42bis

**<h\_comp>**

A numeric parameter that controls PDP header compression:

0 – off (default if value is omitted)

1 – on

2 – RFC1144

3 – RFC2507

## Examples

**AT+CGDCONT?**

## 18.3 AT+CGEQREQ 3G Quality of Service Profile (Requested)

### Description

The test command returns values supported as a compound value.

The read command returns the current settings for each defined context for which a QOS was explicitly specified.

The write command allows the TE to specify a Quality of Service Profile for the context identified by the context identification parameter `<cid>` which is used when the MT sends an Activate PDP Context Request message to the network.

A special form of the write command, `AT+CGEQREQ=<cid>` causes the requested profile for context number `<cid>` to become undefined.

## Defined values

### <cid>

Parameter specifies a particular PDP context definition. The parameter is also used in other PDP

context-related commands.

1...16

#### <Traffic class>

- 0 – conversational
- 1 – streaming
- 2 – interactive
- 3 – background
- 4 – subscribed value

#### <Maximum bitrate UL>

This parameter indicates the maximum number of kbit/s delivered to UMTS(up-link traffic)at a SAP.As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQREQ=...,32,...](#)).

- 0 – subscribed value
- 1...512

#### <Maximum bitrate DL>

This parameter indicates the maximum number of kbit/s delivered to UMTS(down-link traffic)at a SAP.As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQREQ=...,32,...](#)).

- 0 – subscribed value
- 1...16000

#### <Guaranteed bitrate UL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(up-link traffic)at a SAP(provided that there is data to deliver).As an example a bitrate of 32kbit/s would be specified as 32(e.g.[AT+CGEQREQ=...,32,...](#)).

- 0 – subscribed value
- 1...512

#### <Guaranteed bitrate DL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(down-link traffic)at a SAP(provided that there is data to deliver).As an example a bitrate of 32kbit/s would be specified as 32(e.g.[AT+CGEQREQ=...,32,...](#)).

- 0 – subscribed value
- 1...16000

#### <Delivery order>

This parameter indicates whether the UMTS bearer shall provide in-sequence SDU delivery or not.

- 0 – no
- 1 – yes
- 2 – subscribed value

#### <Maximum SDU size>

This parameter indicates the maximum allowed SDU size in octets.

- 0 – subscribed value
- 10...1520 (value needs to be divisible by 10 without remainder)

#### <SDU error ratio>

This parameter indicates the target value for the fraction of SDUs lost or detected as erroneous.SDU error ratio is defined only for conforming traffic.As an example a target SDU error ratio of  $5 \times 10^{-3}$  would be specified as "5E3"(e.g.[AT+CGEQREQ=..,"5E3",...](#)).

“0E0” – subscribed value

“1E2”

“7E3”

“1E3”

“1E4”

“1E5”

“1E6”

“1E1”

#### <Residual bit error ratio>

This parameter indicates the target value for the undetected bit error ratio in the delivered SDUs. If no error detection is requested, Residual bit error ratio indicates the bit error ratio in the delivered SDUs. As an example a target residual bit error ratio of  $5 \times 10^{-3}$  would be specified as “5E3”(e.g. AT +CGEQREQ=...,”5E3”,..).

“0E0” – subscribed value

“5E2”

“1E2”

“5E3”

“4E3”

“1E3”

“1E4”

“1E5”

“1E6”

“6E8”

#### <Delivery of erroneous SDUs>

This parameter indicates whether SDUs detected as erroneous shall be delivered or not.

0 – no

1 – yes

2 – no detect

3 – subscribed value

#### <Transfer delay>

This parameter indicates the targeted time between request to transfer an SDU at one SAP to its delivery at the other SAP,in milliseconds.

0 – subscribed value

10...150 – value needs to be divisible by 10 without remainder

200...950 – value needs to be divisible by 50 without remainder

1000...4000 – value needs to be divisible by 100 without remainder

#### <Traffic handling priority>

This parameter specifies the relative importance for handling of all SDUs belonging to the UMTS Bearer compared to the SDUs of the other bearers.

0 – subscribed value

1 –

2 –

3 –

### *<PDP\_type>*

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol

PPP Point to Point Protocol

IPV6 Internet Protocol Version 6

### *<precedence>*

A numeric parameter which specifies the precedence class:

0 – network subscribed value

1 – high priority

2 – normal priority

3 – low priority

### *<delay>*

A numeric parameter which specifies the delay class:

0 – network subscribed value

1 – delay class 1

2 – delay class 2

3 – delay class 3

4 – delay class 4

### *<reliability>*

A numeric parameter which specifies the reliability class:

0 – network subscribed value

1 – Non real-time traffic,error-sensitive application that cannot cope with data loss

2 – Non real-time traffic,error-sensitive application that can cope with infrequent data loss

3 – Non real-time traffic,error-sensitive application that can cope with data loss, GMM/-SM, and SMS

4 – Real-time traffic,error-sensitive application that can cope with data loss

5 – Real-time traffic error non-sensitive application that can cope with data loss

### *<peak>*

A numeric parameter which specifies the peak throughput class:

- 0 – network subscribed value
- 1 – Up to 1000 (8 kbit/s)
- 2 – Up to 2000 (16 kbit/s)
- 3 – Up to 4000 (32 kbit/s)

## 18.5 AT+CGEQMIN 3G Quality of Service Profile (Minimum acceptable)

### Description

The test command returns values supported as a compound value.

The read command returns the current settings for each defined context for which a QOS was explicitly specified.

The write command allow the TE to specify a Qualility of Service Profile for the context identified by the context identification parameter **<cid>** which is checked by the MT against the negotiated profile returned in the Activate/Modify PDP Context Accept message.

A special form of the write command, **AT+CGEQMIN=<cid>** causes the requested for context number **<cid>** to become undefined.

## Defined values

<cid>

A numeric parameter which specifies a particular PDP context definition (see [AT+CGDCONT](#) command). If no <cid> is specified, the addresses for all defined contexts are returned.

1...16

<PDP\_addr>

A string that identifies the MT in the address space applicable to the PDP. The address may be static or dynamic. For a static address, it will be the one set by the [AT+CGDCONT](#) command when the context was defined. For a dynamic address it will be the one assigned during the last PDP context activation that used the context definition referred to by <cid>. <PDP\_addr> is omitted if none is available.

## Examples

```
AT+CGPADDR=?
+CGPADDR: (1)
OK
AT+CGPADDR=1
+CGPADDR: 1,'0.0.0.0'

## 18.11 AT +CGEREP GPRS event reporting

### Description

The write command enables or disables sending of unsolicited result codes, “**+CGEV**” from MT to TE in the case of certain events occurring in the Packet Domain MT or the network. **<mode>** controls the processing of unsolicited result codes specified within this command. **<bfr>** controls the effect on buffered codes when **<mode>** 1 or 2 is entered. If a setting is not supported by the MT, ERROR or +CME ERROR: is returned.

Read command returns the current **<mode>** and buffer settings.

Test command returns the modes and buffer settings supported by the MT as compound values.

The following unsolicited result codes and the corresponding events are defined:

**+CGEV: REJECT <PDP\_type>, <PDP\_addr>**

A network request for PDP context activation occurred when the MT was unable to report it to the TE with a +CRING unsolicited result code and was automatically rejected.

**+CGEV: NW REACT <PDP\_type>,<PDP\_addr>,[<cid>]**

The network has requested a context reactivation. The <cid> that was used to reactivate the context is provided if known to the MT.

**+CGEV: NW DEACT <PDP\_type>,<PDP\_addr>,[<cid>]**

The network has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

**+CGEV: ME DEACT <PDP\_type>,<PDP\_addr>,[<cid>]**

The mobile equipment has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

**+CGEV: NW DETACH**

The network has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

**+CGEV: ME DETACH**

The mobile equipment has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

**+CGEV: NW CLASS <class>**

The network has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

**+CGEV: ME CLASS <class>**

The mobile equipment has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

## Defined values

### <cid>

Parameter specifies a particular PDP context definition. This is also used in other PDP context-related commands.

1...16

### <auth\_type>

Indicates the types of authentication to be used for the specified context. If CHAP is selected another parameter <passwd> needs to be specified. If PAP is selected two additional parameters <passwd> and <user> need to be specified.

0 – none

1 – PAP  
2 – CHAP

<passwd>

Parameter specifies the password used for authentication. It is required for the authentication types PAP and CHAP.

<user>

Parameter specifies the user name used for authentication. It is required for the authentication type PAP.

## Examples

```
AT+CGAUTH=?  
+CGAUTH: (1-16),(0-2),  
OK  
AT+CGAUTH=1,1,"SIMCOM","123"  
OK
```

## 19 TCP/IP Related Commands

### 19.1 AT+CGSOCKCONT Define socket PDP Context

#### Description

The command specifies socket PDP context parameter values for a PDP context identified by the (local) context identification parameter <cid>. The number of PDP contexts that may be in a defined state at the same time is given by the range returned by the test command.

SIM PIN	References

#### Defined values

##### <cid>

(PDP Context Identifier) a numeric parameter which specifies a particular PDP context definition. The parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.

1...16

**<PDP\_type>**

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol

PPP Point to Point Protocol

IPv6 Internet Protocol Version 6

**<APN>**

(Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network.

**<PDP\_addr>**

A string parameter that identifies the MT in the address space applicable to the PDP.

Read command will continue to return the null string even if an address has been allocated during the PDP start up procedure.

**<d\_comp>**

A numeric parameter that controls PDP data compression:

0 – off (default if value is omitted)

1 – on

2 – V.42bis

**<h\_comp>**

A numeric parameter that controls PDP header compression:

0 – off (default if value is omitted)

1 – on

2 – RFC1144

3 – RFC2507

## Examples

**AT+CGSOCKCONT?**

+CGSOCKDCONT: 1,"IP","","0.0.0.0",0,0

### Defined values

<sock_type>
-------------

a string parameter that identifies the type of transmission protocol.

TCP – Transfer Control Protocol

UDP – User Datagram Protocol

<port>
--------

A numeric parameter that identifies the port of socket, the range of permitted values is 0 to 65535.

<net_state>
-------------

a numeric parameter that indicates the state of PDP context activation:

0 network close (deactivated)

1 network open(activated)

<mode>
--------

a numeric parameter that module is used which mode. At present, it supports three mode, such as single-client, tcp-server and multi-client. if <mode> is 1, then <sock\_type> and <port> are ignored.

0 single-client or tcp-server

1 multi-client

<err\_info>

A string parameter that displays the cause of occurring error.

## Examples

```
AT+NETOPEN="TCP",80
```

*Network opened*

*OK*

```
AT+NETOPEN=?

## Defined values

`<length>`

a numeric parameter which indicates the length of sending data, it must less than 1024.

`<reqSendLength>`

a numeric parameter that requested number of data bytes to be transmitted.

`<cnfSendLength>`

a numeric parameter that confirmed number of data bytes to be transmitted.

-1 the connection is disconnected.

0 own send buffer or other side's congestion window are full.

`<err_info>`

A string parameter that displays the cause of occurring error.

## Examples

`AT+TCPWRITE=12`

`>ABCDEFGHIJKL`

`+TCPWRITE: 12, 12`

## Defined values

<indexX>

A numeric parameter that identifies the index of client, the max number of client is ten, and the range of permitted values is 0 to 9.

<IP\_address>

A string parameter that identifies the IP address of client.

<port>

A numeric parameter that identifies the port of client, the range of permitted values is 0 to 65535.

<err\_info>

A string parameter that displays the cause of occurring error.

## Examples

**AT+LISTCLIENT**

+LISTCLIENT: 0, 10.71.34.32 , 80

+LISTCLIENT: 1, 10.71.78.89, 1020

### Defined values

<client\_index>

A numeric parameter that identifies the client index which will be closed. The allocated index may be read using command **AT+LISTCLIENT**.

<close\_reason>

A numeric parameter that identifies reason that the connection closed.

1 remote side sends a request of closing first.

2 reset the connection because of timeout of sending data, or other reasons.

**<remote\_IP>**

A string parameter that identifies the IP address of client.

**<port>**

A numeric parameter that identifies the port of client.

**<err\_info>**

A string parameter that displays the cause of occurring error.

## Examples

```
AT+CLOSECLIENT=0

## Defined values

<NmRetry>

a numeric parameter which is number of retransmission to be made for an IP packet. The default value is 3.

<DelayTm>

a numeric parameter which is number of milliseconds to delay to output data of Receiving. The default value is 0.

<Ack>

a numeric parameter which sets whether reporting a string “Send ok” when sending some data as a tcp connection.

- 0 not reporting
- 1 reporting

<errMode>

a numeric parameter which sets mode of reporting error result code.

- 0 error result code with numeric values
- 1 error result code with string values

## Examples

```
AT+CIPCCFG=?

Information	Description
Network opened	Indicate that the write command of <a href="#">AT+NETOPEN</a> has excuted successfully.
Network not opened	Indicate that you should execute <a href="#">AT+NETOPEN</a> first.
Network is already opened	Indicate that the write command of <a href="#">AT+NETOPEN</a> has already excuted successfully.
Port overflow	Indicate that input port is out of range.
Create socket failed	Indicate that socket has not been created successfully.
Bind port failed	Indicate that input port is already in use.
Connect ok	Indicate that establishing a connection successfully.
Connection is already created	Indicate that a connection has been already established.
Connect fail	Indicate that establishing a connection unsuccessfully
No clients connected	Indicate that module as TCP server has no any connection.
No active client	Indicate that you should execute <a href="#">AT+ACTC-CLIENT</a> first and select a connection.
Client index overflow	Indicate that input client's index is out of range.
Connection disconnected	Indicate that the remote end has closed the connection.
Socket closed	Indicate that socket is closed.
Network closed	Indicate that the write command of <a href="#">AT+NETCLOSE</a> has excuted successfully.
Network is already closed	Indicate that netwok has been closed now.

## 20 SIM Application Toolkit (SAT) Commands

### 20.1 AT+STIN SAT Indication

#### Description

Every time the SIM Application issues a Proactive Command, via the ME, the TA will receive an indication. This indicates the type of Proactive Command issued.

[AT+STGI](#) must then be used by the TA to request the parameters of the Proactive Command from the ME. Upon receiving the [+STGI](#) response from the ME, the TA must send [AT+STGR](#) to confirm the execution of the Proactive Command and provide any required user response, e.g. a selected menu item.

## 20.2 AT+STGI Get SAT information

### Description

Regularly this command is used upon receipt of an URC "+STIN" to request the parameters of the Proactive Command. Then the TA is expected to acknowledge the **AT+STGI** response with **AT+STGR** to confirm that the Proactive Command has been executed. **AT+STGR** will also provide any user information, e.g. a selected menu item. The Proactive Command type value specifies to which "+STIN" the command is related.

## 21.5 Video Call Commands

### 21.5.1 Unsolicited Indications of Video Call

Indications	Comments
VPINCOM <number>	Indicate an incoming video call and caller information is sent. <number> is caller's phone number of remote party, and this indication will be reported periodically until answered or released. For automatic answering video call, refer to <a href="#">AT+AUTOANSWER</a> and <a href="#">ATS0</a> .
VPACCEPT	Indicate that video call is in the process of being set up.
VPRINGBACK	Indicate that remote party (other side) is located and ringing.
VPSETUP	Indicate that video call is set up end-to-end.
VPCONNECTED	Indicate that video protocols are set up and video call is connected.
VPEND[:<seconds>]	Indicate that video call has ended. <seconds> is the duration of video call, from VPCONNECTED to VPEND and the unit is in second.
MISSED_VIDEO_CALL: <datatime>,<number>	Indicate that an incoming video call is missed. <datatime> denotes when this indication is reprinted, and the format is yy/MM/dd, hh/mm/ss, where characters indicate year (two last digits), month, day, hour, minutes, seconds. <number> is caller's phone number.
+VPRXDTMF: <user_input>	Indicate that a user input was received from remote party.

	<p>&lt;user_input&gt; is DTMFstone from remote party, and consisted of (0-9, *, #).</p> <p><b>NOTE</b> DTMFs are sent as an H.245 User Input Indication message (basic string).</p>

## 21.6 File Transmission Flow

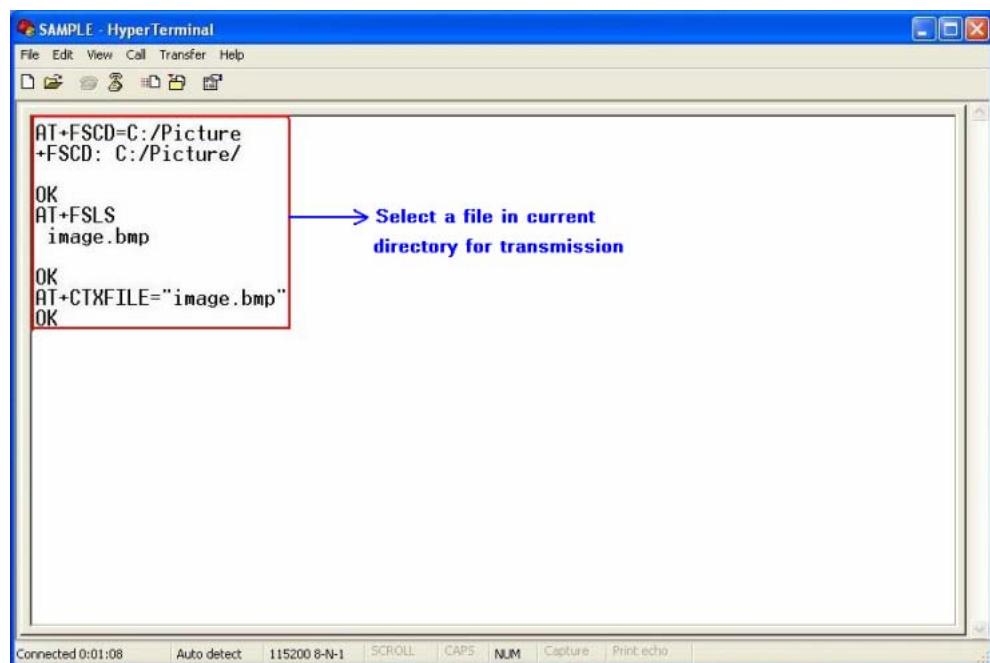

The Module supports to transmit files from the Module to PC host and from PC host to the Module over Xmodem protocol. During the process of transmission, it can not emit any AT commands to do other things.

### 21.6.1 File transmission to PC host

#### Step1. Select file for transmission to PC host

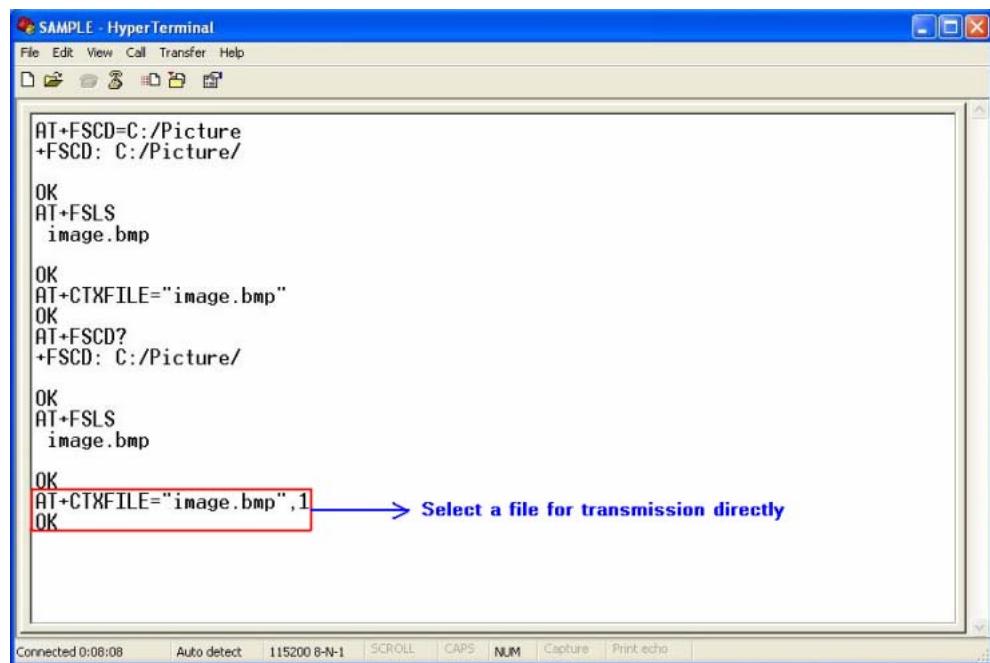

After HyperTerminal is OK for emitting AT commands, it must select a file by one of following methods:

- ①. Select directory as current directory by [AT+FSCD](#), and then select file with parameter [`<dir\_type>`](#) of [AT+CTXFILE](#) is 0 or omitted. [Figure 17-1]

**Figure 17-1 Select file for transmission**

- ②. Select the file directly with subparameter <dir\_type> of **AT+CTXFILE** is not 0 and not omitted; this method is a shortcut method for limited directories. [Figure 17-2]

**Figure 17-2 Select file directly for transmission**

## Step2. Open “Receive File” dialog box

After select transmitted file successfully, use “Transfer>Receive File...” menu to open “Receive File” dialog box in HyperTerminal. [Figure 17-3]

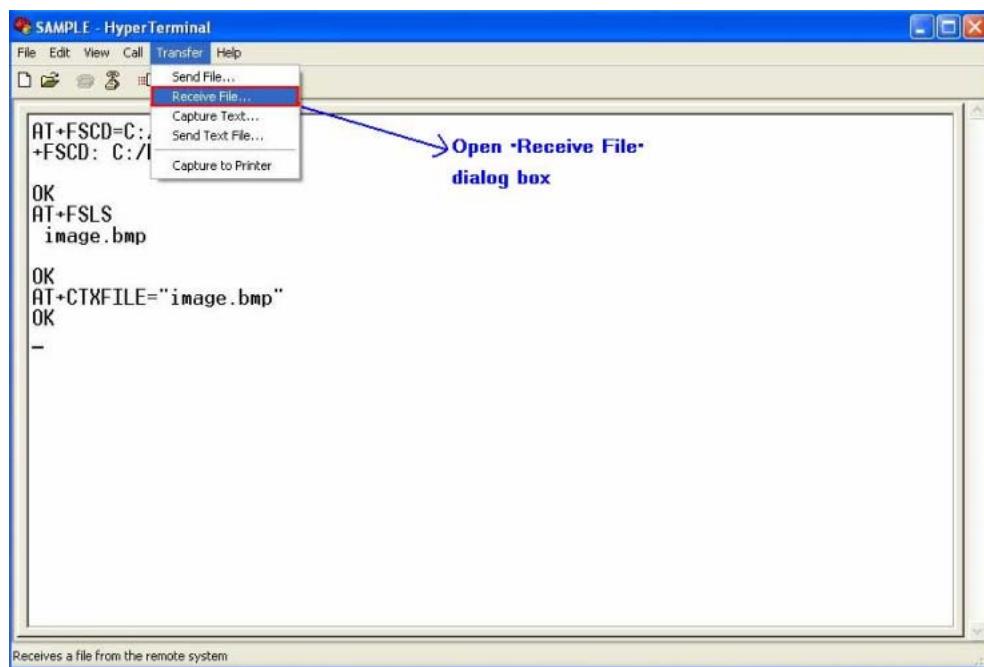

Figure 17-3 Open “Receive File” dialog box

### Step3. Set storage place and receiving protocol

In “Receive File” dialog box, set the storage place in PC host where file transmitted is saved in text box, and select receiving protocol in combo box.

Then click “Receive” button to open “Receive Filename” dialog box. [Figure 17-4]

**NOTE** The receiving protocol must be “Xmodem” protocol.

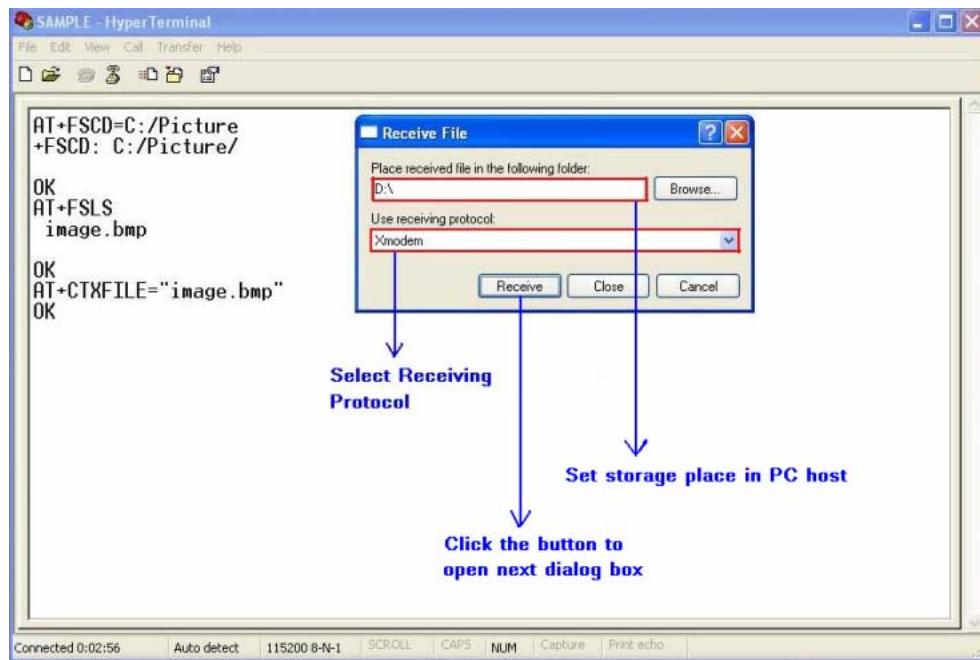

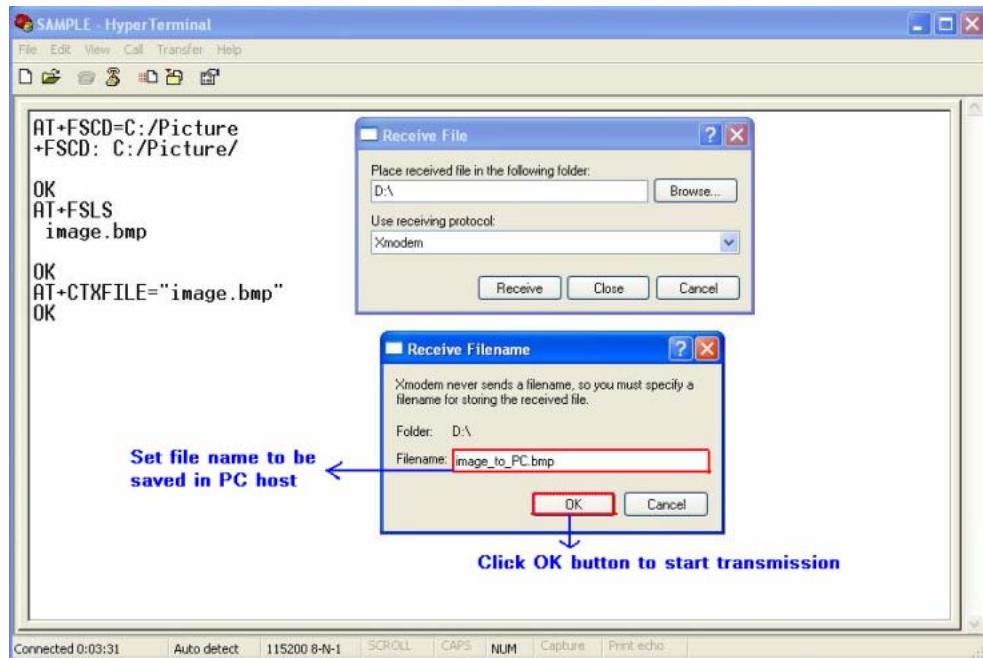

Figure 17-4 Storage place and receiving protocol

### Step4. Set file name

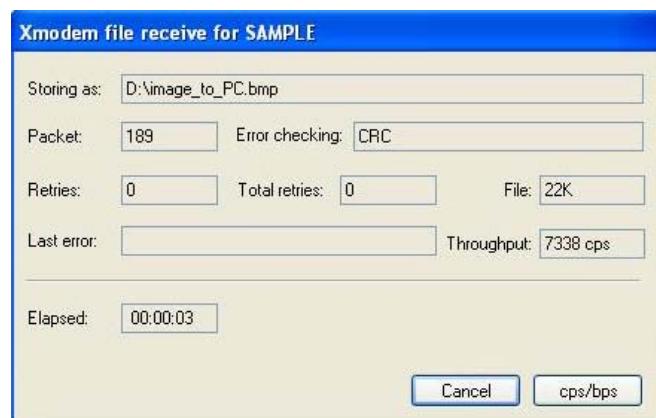

In “Receive Filename” dialog box, input file name in “Filename” text box. And then click “OK” button to start transmitting file. [Figure 17-5]

**Figure 17-5 Set file name**

#### Step5. Transmit the file

After start file transmission, it can't emit any AT commands until transmission stops. In “Xmodem file receive” dialog box, it will display the process of transmission. [Figure 17-6]

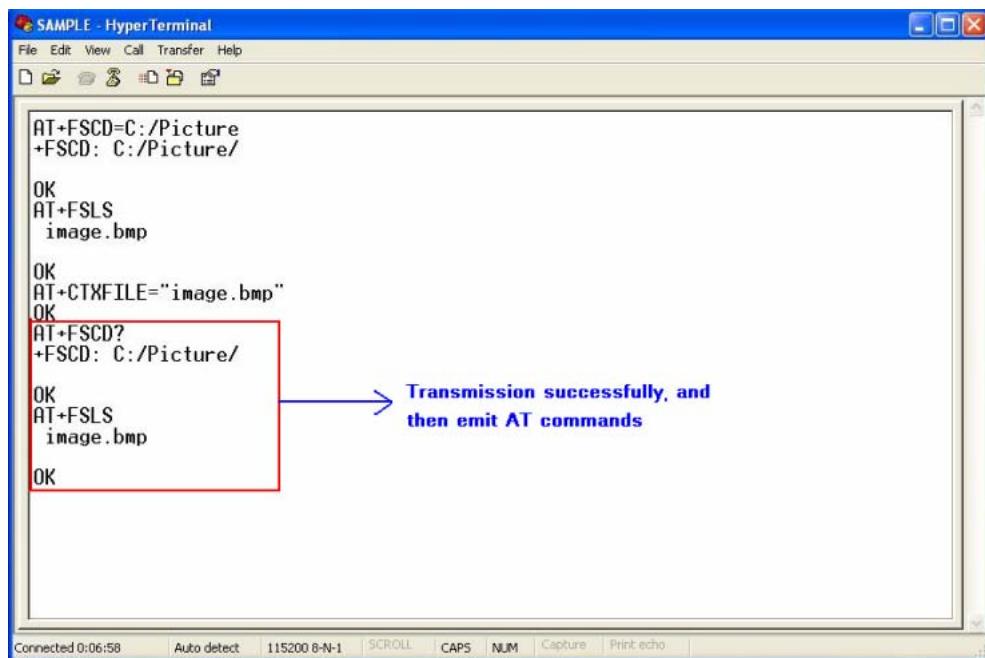

**Figure 17-6 Xmodem file receive**

If cancel the transmission, HyperTerminal will prompt “Transfer cancelled by user”. [Figure 17-7]

**Figure 17-7 Cancel transmission**

After transmission successfully, the receiving dialog box is closed and it can emit AT commands in HyperTerminal. [Figure 17-8]

The screenshot shows a HyperTerminal window titled "SAMPLE - HyperTerminal". The terminal window has a menu bar: File, Edit, View, Call, Transfer, Help. Below the menu is a toolbar with icons for copy, paste, cut, etc. The main text area contains the following text:

```

AT+FSCD=C:/Picture
+FSCD: C:/Picture/
OK
AT+FSLS
image.bmp
OK
AT+CTXFILE="image.bmp"
OK
AT+FSCD?
+FSCD: C:/Picture/
OK
AT+FSLS
image.bmp
OK
  
```

A red box highlights the text "AT+FSCD?" and "OK" from the second line. An arrow points from this highlighted text to the right, with the text "Transmission successfully, and then emit AT commands" written next to it.

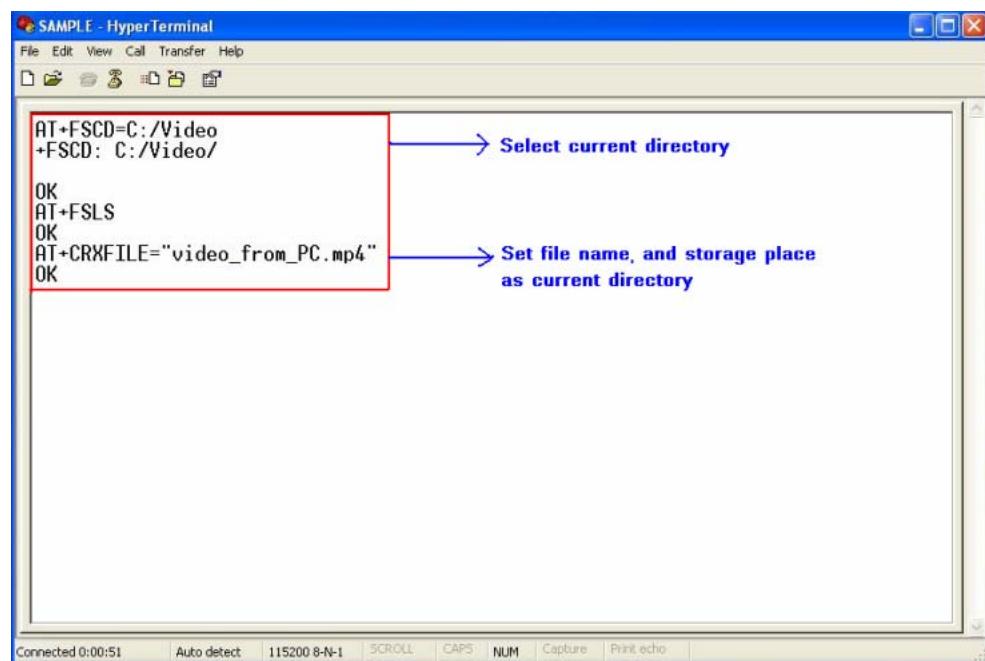

Figure 17-8 Transmission successfully

### 21.6.2 File received from PC host

#### Step1. Set file name and storage place

Firstly, it must set file name and storage place in file system of module by one of following methods:

- ①. Select directory as current directory by [AT+FSCD](#), and then set file name and storage place as current directory with parameter <dir\_type>of [AT+CRXFILE](#) is 0 or omitted. [Figure 17-9]

The screenshot shows a HyperTerminal window titled "SAMPLE - HyperTerminal". The terminal window has a menu bar: File, Edit, View, Call, Transfer, Help. Below the menu is a toolbar with icons for copy, paste, cut, etc. The main text area contains the following text:

```

AT+FSCD=C:/Video
+FSCD: C:/Video/
OK
AT+FSLS
OK
AT+CRXFILE="video_from_PC.mp4"
OK
  
```

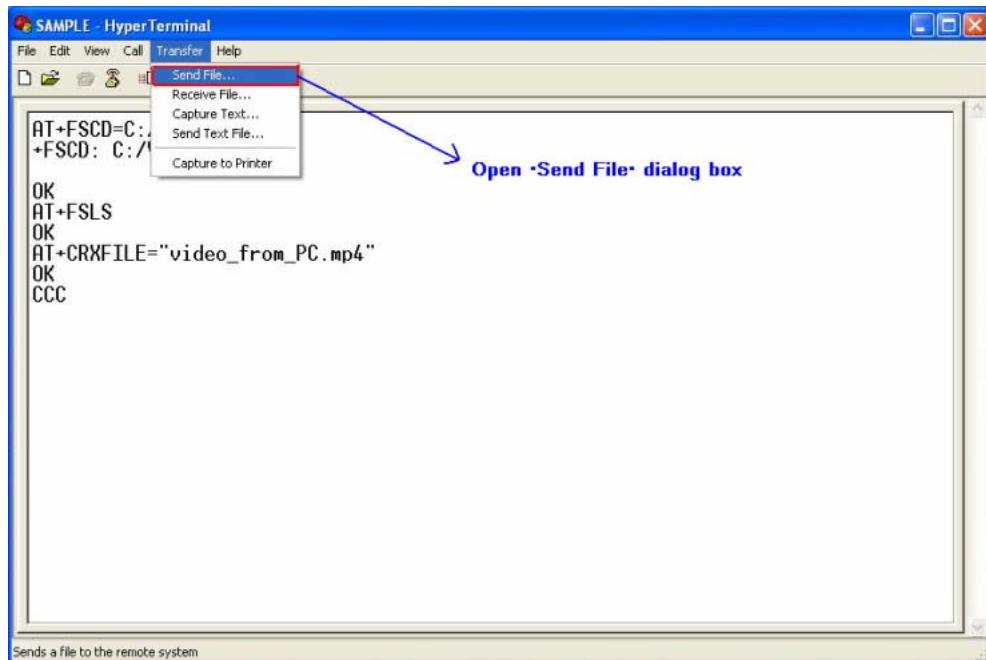

A red box highlights the first two lines of text: "AT+FSCD=C:/Video" and "+FSCD: C:/Video/". An arrow points from this highlighted text to the right, with the text "Select current directory" written next to it. Another red box highlights the last two lines of text: "AT+CRXFILE="video\_from\_PC.mp4"" and "OK". An arrow points from this highlighted text to the right, with the text "Set file name, and storage place as current directory" written next to it.

**Figure 17-9 Set file name and storage place**

②. Set storage place directly with parameter <dir\_type> of **AT+CTXFILE** is not 0 and not omitted; this method is a shortcut method for limited directories.

### Step2. Open “Send File” dialog box

After set file name and storage place successfully, use “Transfer>Send File...” menu to open “Send File” dialog box in HyperTerminal. [Figure 17-10]

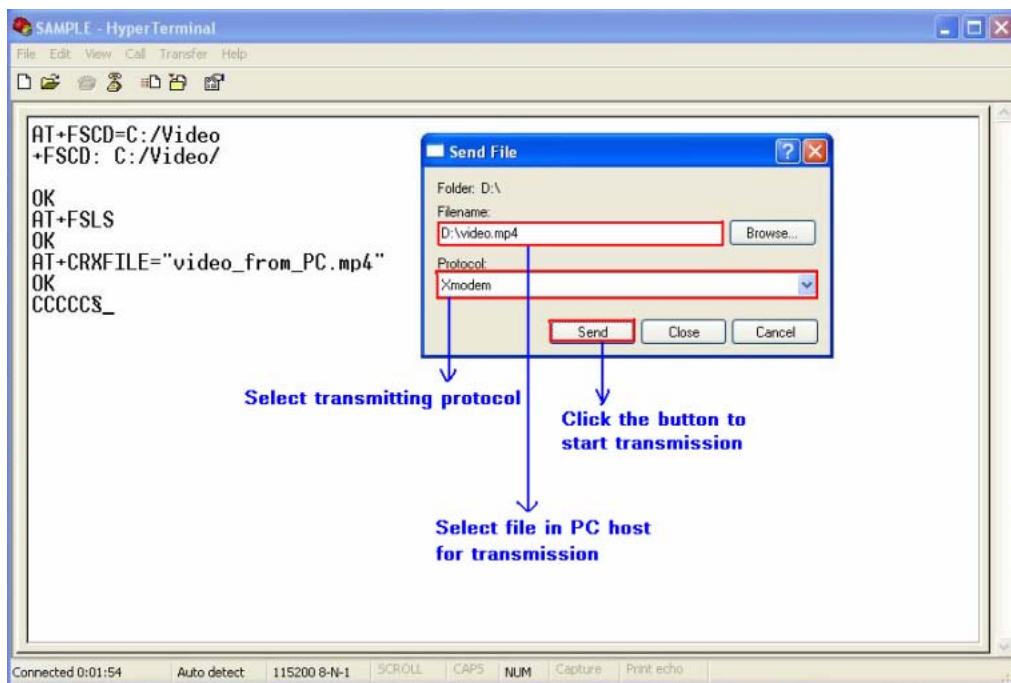

**Figure 17-10 Open “Send File” dialog box**

### Step3. Select file and transmitting protocol

In “Send File” dialog box, select the file to be transmitted in text box, and select the transmitting protocol in combo box. Then click “Send” button to start transmission. [Figure 17-11]

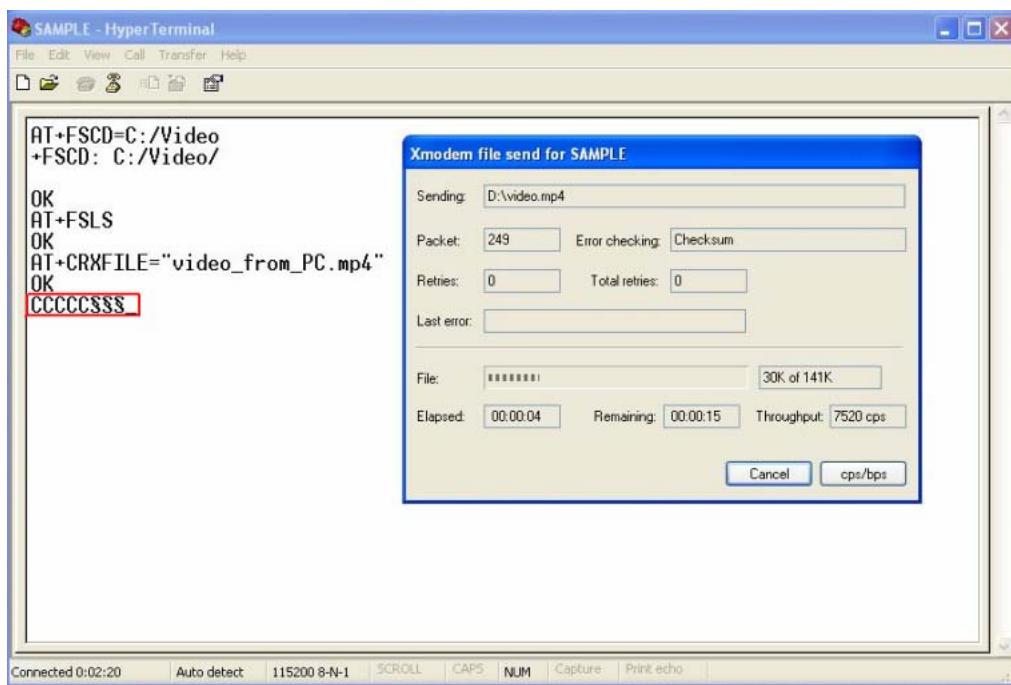

**NOTE** The transmitting protocol must be “Xmodem” protocol.

**Figure 17-11 Select file and protocol**

#### Step4. File transmission

After start file transmission, it can't emit any AT commands until transmission stops. In “Xmodem file send” dialog box, it will display the process of transmission. [Figure 17-12]

**Figure 17-12 The process of file transmission**

If cancel the transmission, HyperTerminal will prompt “Transfer cancelled by user”.

**NOTE** There may be some characters reported which denote interactions between module and PC host.
